Features of Web Browsers

Web browsers come equipped with various features that enhance the user's experience while navigating the internet. Here are some key features:

1. **User Interface:** Browsers offer a clean and intuitive interface, including address bars to enter URLs, back and forward buttons for easy navigation, and tabs to open multiple web pages simultaneously.
2. **Rendering Engine:** This core feature interprets and displays web pages by processing HTML, CSS, and JavaScript, ensuring content appears correctly.
3. **Security:** Browsers protect users through secure connections (HTTPS), warnings about unsafe websites, phishing protection, and private or incognito modes that don't save browsing history or cookies.
4. **Bookmarking:** Users can save favorite websites for quick access later.
5. **Extensions and Plugins:** These add extra functionalities such as ad blockers, password managers, and productivity tools.
6. **Search Integration:** Browsers include built-in search engines, allowing users to search the web directly from the address bar.
7. **Auto-fill and Password Management:** They save and automatically fill in forms and login credentials to simplify repeated tasks.
8. **History and Downloads:** Browsers keep a record of visited pages and downloaded files for easy retrieval.
9. **Cross-Platform Support:** Many browsers sync bookmarks, settings, and passwords across devices, providing a seamless experience.
