

CCA - 101 : Fundamentals of IT & Programming  
Assignment

Q17) What are the four fundamental parts of the computer? Explain it with the help of diagram.

Ans = The four fundamental parts of computer are:

A computer has four main components: Input Units, the Central processing unit or CPU, the Primary memory, and output units. A system bus connects all four components, passing and relaying information among them. This type of computer organization and architecture is called a "Von Neumann machine," after John von Neumann, who finalized the theory and design of the first modern digital computer.

• Input Units

Input units are all the devices you used to feed information to the computer, such as keyboard, a hard drive or a networking card. These devices, in essence, bring data from the "outside world" into your computer, in much the same way that your eyes and ears bring information to your brain. Each input device has its own hardware controller that connects to the CPU and primary memory, and it has a set of instructions that tells the CPU how to use it.

• CPU :-

Computer Scientists typically call the CPU the "brain" of the computer because this is where programs are executed. A program is a set of instructions that tells the computer how to accomplish a specific task, such as sending a file to the printer, opening a browser window or playing music or video.

• Output units :- Output units are the devices your computer use

to relay information to the user, such as a printer, monitors and speakers. For e.g., everything you see on your computer monitors starts as machine code in memory. The CPU takes that machine code and converts it into a format required by your monitor's hardware. Your monitor's hardware then converts that information into different light intensities so that you see words or pictures.

### • Primary Storage :-

Once the CPU converts a specific set of computer program instruction into machine code, it stores that machine code in primary storage or memory. The machine code will be treated as either data or instruction. The CPU fetches data and instructions from memory, uses an instruction to manipulate the data, and then sends the result and the next set of instructions back to memory.

Q:2 Discuss about the classification of computer based on size and capacity.

Ans Introduction :- Classification of computer are

based on their architecture, speed of executing commands or instructions, peripheral used and also their uses. Microcomputers are usually used and their uses. Microcomputers are usually used in the home and offices and only a single user can perform the task using a microcomputer. Its storage and data handling capacity are limited as per the requirement for home and office work. The another type of computer is called minicomputer which has usually larger storage and can handle multiple users at a time.

### Computer Classification :-

Computers are classified on different parameters, such as storage capacity, processing speed and component (CPU) used in computer. Depending up on the components used and features of different computers, they are classified into four groups: Microcomputers, Minicomputers, Mainframe Computers and Supercomputers.

### Micro Computers :-

Micro computer is a computer whose CPU (central processing

unit) is a micro-processor. All the components of a microprocessor are on a single integrated circuit chip. Micro Computers can be categorized as the desktop, programmable and workstation. The microprocessor based computers are called third generation computers. They are the backbone of the modern computer era. The first and second generation computers are based on vacuum tubes and bipolar junction transistors.

Mini Computers -

Micro Computer is a computer whose CPU (central processing unit) is a microprocessor. All the components of a microprocessor are on a single integrated circuit chip. Micro computers can be categorized as the desktop, programmable and workstation. The microprocessor based computers are called third generation computers. They are the backbone of the modern computer era. The first and second generation computers are based on vacuum tubes and bipolar junction transistors.

Mini Computer had large instruction set and address field. These

Kind of Computer have efficient process speed and memory etc. Sizes, mini-computer here used in variety of application, and could support business applications along with Scientific Comparison of Micro computer.

Features	Microcomputer	Minicomputer
Primary memory	Small memory	Larger memory
word length	Small word length	Larger word length
Cost	Low	High
Processor	Low	High

### Mainframe Computers:

Mainframe Computers are large and expensive machines. The word length of mainframe computer may be 48, 60 or 64 bits, memory capacity being in some megabytes and storage capacity in some terabytes. Generally they handle huge volumes of information and data in terms of speed, they are having significant processing capacity. They are used in research organizations, large industries, airlines reservation where a large database has to be maintained.

Super Computers : Super computers are the faster computer in current era. The processing capabilities of super computer lies in the range of GIPS 2, word length 64-128 or may be in 256 or 30. The memory capacity of this type of computer is in exabytes.

Q83 what is the meaning of computer generation? How many computer generations are defined? what technologies were used?

Ans Generation in computer technology is a change in technology a computer is was being used. Initially, the generation term was used to distinguish between varying hardware technologies. Nowadays, generation include both hardware and software which together make up an entire computer system.

These are five computer generations known till date. Each generation has been discussed in detail along with their time period. Following are the main five generation of computer.

• First Generation Computer.

The period of first generation was from 1946-1954. The computers of first generation used vacuum tubes as the basic component for memory and circuit for CPU (central processing unit). These tubes, like electric bulbs, produced a lot of heat and the installation used to fuse frequently. Therefore, they were very expensive and only large organizations were able to afford it.

In this generation, mainly batch processing operating system was used. Punch cards, paper tape and magnetic tape was used as input and output devices. The computer in this generation used machine code as the programming language.

• Second generation computers :

The period of second generation was from 1959-1965. In this generation, transistors were used than were cheaper, consumed less power, more compact in size, more reliable and faster than the

first generation machines made of vacuum tubes. In this generation, magnetic cores were used as the primary memory and magnetic tape and magnetic disks as secondary storage devices.

In this generation, assembly language and high-level programming like FORTRAN, COBOL are used. The computer used batch processing and multiprogramming operating system.

Third generation computers.

The period of third generations was from 1965-1971. The computers of third generation used Integrated Circuits (ICs) in place of transistors. A single IC has many transistors, resistors, and capacitors along with the associated circuitry.

The IC was invented by Jack Kilby. This development made computers smaller in size, reliable, and efficient. In this generation remote processing, time-sharing, multi-programming operating system were used. High-level languages (FORTRAN-II to IV, COBOL, PASCAL, PL/I, BASIC

ALGOL-68 etc)

- Fourth Generation Computers :- The period of fourth generation was from 1971-1980. computers of fourth generation used Very Large Scale Integrated (VLSI) circuits. VLSI circuits having about 5000 transistors and other circuit elements with their associated circuits on a single chip made it possible to have microcomputers of fourth generations. Fourth generation computers became more powerful, compact, reliable, and affordable. As a result, it gave rise to personal computer (PC) revolution. In this generation, time sharing, real time networks, distributed operating system were used. All the high level languages like C, C++, DBASE etc. were used in this generation.

- Fifth Generation Computers :- The period of fifth generation is 1980 - till date. In the fifth generation, LSI technology became VLSI (Ultra large Scale Integration) technology, resulting in the production of microprocessor chips having ten million electronic components.

This generation is based on parallel processing hardware and AI (Artificial Intelligence) Software. AI is an emerging branch in Computer Science, which interprets the mean and method of making computers think like human beings. All the high-level languages like C and C++, Java, Net etc., are used in this generation.

Q.4 Differentiate between Volatile Memory and Non-Volatile memories.

<u>Ans</u> Volatile memory	Non-Volatile Memory
----------------------------	---------------------

(1) Volatile memory is the type of memory in which data is lost as it is powered-off	(1) Non-volatile memory is the type of memory in which data remains stored even if it is powered-off
--	--

(2) Contents of Volatile memory is stored temporarily.	(2) Contents of Non-Volatile memory is stored permanently.
--	--

(3) It is faster than non-volatile memory.	(3) It is slower than volatile memory.
--	--

(4) RAM (Random Access memory)	(4) ROM (Read only memory)
--------------------------------	----------------------------

is an example of volatile memory.

is an example of non-volatile memory.

(5.) Volatile memory generally has less storage capacity.

(5.) Non-volatile memory process can only read.

(6.) In volatile memory, process can read and write.

(6.) In volatile memory, process can only read.

(7.) Volatile memory is more costly per unit size.

(7.) Non-volatile memory is less costly per unit size.

(8.) In volatile memory, processor has direct access to data.

(8.) In non-volatile memory, processor has not direct access to data.

9.) Volatile memory chips are generally kept on the memory slot.

9.) Non-volatile memory chips are embedded on the motherboard.

Qos Distinguish among system software, application software and open source software on the basis of their feature.

Ans Software is of two types namely system software and application software. They both differ in terms of their purpose.

and design. System software is meant to administer the system resources. It also serves as a kind of platform for running the application software. On the other hand, application software is meant to enable the user to carry out some specific set of tasks or functions.

Difference b/w system software and Application Software:

System software

Application software

1.) System software is meant to manage the system resources. It serves as the platform to run application software.

1.) Application software helps perform a specific set of functions for which they have been designed.

2.) System software is developed in a low level language (assembly language for example).

2.) Application software is developed in a high-level language such as Java, C++, net and VB.

3.) System software automatically starts running once the

3.) Application software runs as and when

System is turned on and when the user request it. And stop when the system is shut down.

4.) A system cannot even start without system software.

4.) Application software are is user specific and it is not needed to run the system on the whole.

5.) System software is endowed with a general purpose.

5.) Application software carries a specific purpose.

6.) A typical example for a system software is window operating system.

6.) Some characteristic examples for application software is MS office photoshop and Core/Draw.

Q:6(a) Create a file in MS word to insert a paragraph about yourself and save it with file name 'yourself'. Describe all steps involve in it.

Ans Step I Open MS word on your system.

Step II click on the new file when you open the word file when the dialog box appear.

Step 3: Once this click on Blank doc under the recent section, it will get in bold or highlighted by default.

Step 4: Click on the create A new blank doc will open.

Step 5: Once it opened you can write anything you want in the doc for yourself.

Step 6: You can also edit the text you have written as you can change the background colour, as the text and many other things in the docs, and save the file using  $Ctrl + S$ .

Q3(b) write steps regarding followings:-

- To Change the font style.  
The basic steps to change the font of a text in a document are given below.
- Select the text you want to modify.
- Select the home tab and locate the font group.
- Click the drop-down arrow next to font style box.
- Font style menu appears.

with a left click select the desired font style.

If you want to change the font to bold or italic, click the 'B' or 'I' icons on the format bar.

- To change the font size.  
Ans Select the text you want to modify.

click the drop-down arrow next to the font size on the Home. involved in it

- click the file tab.
- Select New. The new Document dialog box appears.
- Select New. The New Document dialog box appears.
- Select Blank document. It will be highlighted by default.
- A new blank document appears in the word window.
- Now you can create document by insert text.
- finally Save document.

Q:8 Create a file in MS-Word for the following document, and save it with file name 'equations'. Describe all steps involved in it.

Equations

$$Y_2 + Y_5 = 30$$

$$Z^3 + Q^4 = 50$$

$$A_2 + B^8 = X_2 + Y^8$$

Ans To create a new document.

Click the Microsoft office button / File Tab  
Select New, The New Document dialog  
box appears.

Select Blank Document. It will be high-  
lighted by default.

A new blank document appears in the  
word window.

Now you can create document by  
inserting equation.

$$Y_2 + Y_5 = 30$$

$$Z^3 + Q^4 = 50$$

$$A_2 + B^8 = X_2 + Y^8$$

Click the Save button.

Finally Save your document.

Q99 Create a file in MS-Word that convert  
existing highlight text to table as  
shown below and save it as file name

Text - to - table Describe all steps involved in it?

Ans Select the text you want to convert

Select the Insert Tab.

Click on table command. A dialog box appears.

Here set number of columns.

Click on OK finally selected text convert in a table.

Select the text you want to convert.	Select the Insert Tab.
Click on Table command. A dialog box appears.	Click on Convert text to table, a new dialog box appears.
Here set number of columns.	Click on OK <sup>finally</sup> select text convert in a table.

Q:10 Create a file in MS-Word to insert a table in the document. Describe all steps involved in it.

Ans The steps to insert table are given below

- Open a blank word document.
- In the top ribbon, press insert.

- Place the cursor where you want to insert the table.
- Select the insert tab.
- In Table group click the table command.
- It displays different option to insert the table.
- Select the desired option to insert the table.

Q:11 Create a following marksheet in MS Excel and save it with name 'book 1'

Roll No	A	B	C
1	Roll No	Name	Marks
2	1	m <sub>1</sub>	60
3	2	m <sub>2</sub>	70
4	3	m <sub>3</sub>	80
5	4	m <sub>4</sub>	90
6	5	m <sub>5</sub>	40
7	6	m <sub>6</sub>	50
8	7	m <sub>7</sub>	77
9	8	m <sub>8</sub>	44
10	9	m <sub>9</sub>	88
11	10	m <sub>10</sub>	55
12			
13			
14			
15			
16			
17			
18			

19

20

21

22

Student

Sheet 2

Sheet

- Right - click the worksheet name tab.
- Click Select Move or Copy.
- Click on the Move Selected Sheets to Books drop-down menu. Select (new book).
- Click OK. Your new workbook opens with your moved worksheet.....
- Click file > Save in your new workbook.

Q:12 Calculate the following things of a range (C2:C11) of data in the worksheet created in question no.10.

- The Sum of the marks using Auto Sum in a range of cells (C2:C11).

Ans To Create the Sum of a range of data using Auto Sum:

- Select the cell where you want to appear function.
- Select the drop down arrow next to the Auto Sum command on home tab.
- Select Sum. A formula will appear in the selected cell, C4.

This formula = Sum(C2:C11) is called a function. The Auto Sum command automatically selects the range of cells from C2 to C11, based on where you insert the function. You can alter the cell range if necessary.

Press the Enter key. The total will appear = SUM (C2 : C11) = 115

- average of the marks in a range of cells (C2:C11).

Ans To calculate the average of a range of data:

- Click on the first cell to be included in the formula.
- Left-click and drag the mouse to define a cell range (C2 through Cell C11)
- Click the drop down arrow next to the Auto Sum Command.
- Select Average.

highest marks in the range (C2:C11)  
Ans Highest marks in the range (C2:C11) - (A5 : C5) is 90.

• minimum marks in a range of cells (C2:C4)

Ans Minimum marks in a range of cell (C2) is (A6:C6) i.e 40.

Q13(a) Describe Various steps involved in the following.

• To modify column of width of a worksheet

Ans • To modify column width

- Position the cursor over the column line in the column heading.
- and a double arrow will appear.
- Left-click the mouse, then drag the cursor to the right to increase.
- the column width or to the left to decrease the column width.
- Release the mouse button.

• To modify the row height of a worksheet

Ans Position the cursor over the row line you want to modify, and a double arrow will appear.

Left-click the mouse then drag the cursor upward to decrease the row height.

- Release the mouse button.
- To delete rows and columns of a worksheet.

Ans To delete rows and columns:

- Select the rows or columns you want to delete.
- Click the Delete Command in the cells group on the home tab.
- Selected columns or rows deleted.

Q13 (b) Describe following terms in a worksheet

- Absolute references and relative references in formula:

Ans There are two types of cell references: relative and absolute. . . . Relative references change when a formula is copied to another cell. Absolute references, on the other hand, remain constant, no matter where they are copied.

• Cell Address

Ans A reference is a cell's address. It identifies a cell or range of cells by referring to the column letter and row number of the cell(s). For example, All refer

to the cells at the intersection of Column A and row 1.

Q 14 (g) What tools are available to customize our Power point presentation?

Ans Tools are available to customize our Power point presentation:

### Home

The Home tab holds the cut and paste features, font and paragraph options, and what you need to add and organize slides.

### Insert

Click insert to add something to a slide. This include pictures shapes, charts, links, text boxes, videos and more.

### Design

On the design tab, you can add a theme or colour scheme, or format the slide background.

### Transitions

Set up how your slides change from one to the next on the Transitions

tab. Find a gallery of the possible transitions in the transition to this slide group - click More ▾ at the slide of the gallery to see all of them.

Animations : Use the Animations tab to choreograph the movement to things on your slides. Note that you can see many possible animations in the gallery in the Animation group, and see more of them by clicking More ▾

Slide Show : On the Slide Show tab, set up the way that you want to show your presentation to others.

Review : The Reviews tab lets you add comments, run spell-check, or compare one presentation with another (such as an earlier version).

Views : Views allows you to look at your presentation in different ways, depending on where you are in the creation or delivery process.

Tool Tabs when you click some parts of your (presentation in different) slides, su

pictures, shapes, small art or text boxes, you might see a colourful new tab appear.

In the example above, the Drawing Tools tab appears when you click a shape or text box. when you click a picture, the Picture Tools tab appears. Other such tabs include Smart Art Tools, Chart Tools, Table Tools and Video Tools. These tabs disappear or change when you click something else in your presentation.

Q.14(b) write the steps for the following action for creation of power point presentation.

- open a Blank Presentation
- Ans Power point files are called presentation whenever you start a new project in Power Point, you'll need to create a new presentation, which can either be blank or from a template. You'll also need to know how to open an existing presentation.

To create a new presentation.

- Select the file tab to go to backstage view.
- select New on the left side of the windows then click Blank presentation or choose a theme.

A new presentation will appear.

- Save the presentation as Labs 1.pptm.

Ans Locate and select the Save command on the Quick Access Toolbar.

If you're saving the file for the first time, the Save as pane will appear in backstage view.

You'll then need to choose where to save the file and give it a file name. Save as dialog box will appear.

- Add a Title for the first slide: the name of your college.

Ans Select the slide whose layout you will change so that it can have a title.

Click Home > Layout

Select Title slide box a standalone title page or select title and content for a slide that contains a title and a full slide text box.

Select the click to add title text box.

- Type your first name and last name in the subtitle section.

Ans Open power point presentation and scroll to the slide to add the signature.

Click a text box on the slide or add one by clicking the "insert" tab clicking the text box button and dragging the mouse to form the text box.

Type the phrase "Created by" in the text box. Proceed to either "with Graph" or "By hand" section.

- Add a New slide which has a title and content.

Ans Select the slide whose layout you will change so that it can have a title.

Click Home > Layout.

Select Title slide for a standalone title page or select Title and content for a slide that contains a title and full slide text box.

Select the click to add title text box.

Q:15 write steps for creation of a set of power point slides that demonstrates your skills to use the tools of power point. It should include the following things.

- Title slides and bullet list.
- Inserting Excel sheet
- clip art and text
- show slide effects.

Ans Creating a power point slide.

Step I : Open Microsoft power point.

Step II : Go to file at the top of the screen and click New. A box that says "New presentation" should appear on the right side of your screen.

Step 3 : In the "New presentation" dialog box click on "from Design Template". You may then scan through templates and choose one that you like.

Step 4 : Slide Design Select a design template by clicking on the template that

that you like. You may choose a different colour for your template by clicking on "Colour Schemes" in the "New Presentation" dialog box.

Step 5: Slide <sup>Layout</sup> Design: Change the Slide Layout

You may change the slide layout by going to the top of the screen and clicking on "Format" - "Slide Layout". A box will appear on the right side of your screen labeled "Slide Layout". You may select a design by clicking on it.

Step 6: Adding Text

Enter your text by clicking on "Format" - "Slide Layout". A box will appear on the right side of your screen labeled "Slide Layout". You may select a design by clicking on it.

Step 6: Adding Text Pictures:

You may add pictures by clicking on the box that says "Clicking to add content?". Inside that box, there will be a smaller box with size icons. Click on the icon that looks like a photograph of a mountain. A new window will open.

allowing you to browse for a picture on your computer or a C.D once you find your picture, click on it and then click "Insert".

### Step 8: Resizing Pictures:

You may change the size of your picture by clicking on the picture. The picture will then have black lines around it with small bubbles or boxes in the corners. Place your mouse over the bubbles or boxes and click. Holding the mouse pointer down drag the picture to the size you want.

### Part 2

Q16 what is the difference between Machine Language and High level language?

Ans we will now understand the difference between High-level and Machine languages -

#### High level Languages

1.) It can be considered as a programmer-friendly language.

#### Machine Language

1.) It is considered a low-level language.

- (2) It is easy to debug. (2) It is difficult to debug.
- 3) It requires a compiler/interpreter to be translated into machine code. (3) It requires an assembler that would translate instructions.
- (4) It can be ported from one location to another. (4) It is not portable.
- (5) It is easy to understand. (5) It is difficult to understand.
- (6) It is less memory efficient i.e. it consumes more memory in comparison to machine language. (6) It consumes less memory.

Q:17 Discuss about different types of C programming language.

Ans Each variable in C has an associated data type. Each data type requires different amounts of memory and has some specific operations which can be performed over it. Let us briefly describe them one by one.

Char

The most basic data type in C. It stores a single character and requires a single byte of memory in almost all.

Int

As the name suggests, an int variable is used to store an integer.

float

It is used to store decimal numbers (numbers with floating point value).

double

It is used to store decimal numbers (numbers with floating point value but its range of values is high in comparison to float).

Type

Keyword

value range which can be represented by this data type

Character

char

128 to 127 or 0 to

Number

int

-32,768 to 32,767  
2, 147, 483, 648 to 2  
147, 483, 647

Small Number	Short	-32,768 to 32,767
Long Number	Long	-2,147,483,648 to 2,147,483,647
Decimal Number	Float	1.2E-38 to 3.4E to 38 till 6 decimal places.

Q18 Find the output of the following expressions.

(a)  $X = 20 / 5 \times 2 + 30 - 5$

Ans 33

(b)  $Y = 30 - (40 / 10 + 6) + 10$

Ans 30

(c)  $Z = 40 \times 2 / 10 - 2 + 10$

Ans 16

Q19 Describe the syntax of the following statements.

(a) if - else statement

Ans The syntax of an if... else statement in C programming language is -

if (boolean-expression) {

/\* Statement (s) will execute if the boolean expression is true x / } else {

/\* Statement (s) will execute if the boolean expression is false x / }

(b) for loop

Ans for (initialization Statement ; test Expression ; update Statement

|| Statements  
}

(c) while loop

Ans while (condition) {  
Statements ;  
}

(d) do-while loop

Ans do {  
Statements  
} while (expression) ;

Q:20 Find the output of the following program segments.

<p>a)</p> <pre>#include &lt;stdio.h&gt; int main() {</pre>	<p>(b)</p> <pre>#include &lt;stdio.h&gt; int main() {</pre>	<p>(c)</p> <pre>#include &lt;stdio.h&gt; void main() {</pre>
--	---	--

<pre> { int i; for (i=1; i&lt;=2; i++) { print f ("GMS Ghaziabad bad  m"); } } </pre>	<pre> { int i = 1; while (i &lt;= 2) { print f ("GMS Ghaziabad  m"); i = i + 1; } } </pre>	<pre> { int a = 10, b = 100; if (a &gt; b) print f ("Largest number is %d  m", a); else print f ("L argest number is %d  m", b); } </pre>
---	--	---

Ans GMS Ghaziabad

GMS Ghaziabad  
GMS Ghaziabad

Largest number  
is 100.
