

Google Hangouts, now evolved into **Google Chat** and **Google Meet**, is a communication platform developed by Google. Originally launched as a simple messaging and video chat tool, Hangouts allowed users to send instant messages, make voice and video calls, and conduct group conversations. It was designed to integrate smoothly with other Google services like Gmail and Google Calendar, making it convenient for both personal and professional use.

With Hangouts, users could chat one-on-one or in groups, share images, videos, and emojis, and even start video calls directly from a Gmail conversation. It worked on both mobile devices and desktops, allowing for seamless communication across platforms.

Over time, Google shifted its focus toward more business-oriented tools. As a result, Hangouts was split into **Google Chat** (for text messaging and collaboration) and **Google Meet** (for video meetings). Google Chat offers enhanced features such as threaded conversations, rooms (now called Spaces), and integration with Google Workspace apps like Docs and Drive, making it ideal for team collaboration.

Despite its evolution, the core purpose remains the same: to provide fast, reliable, and integrated communication. Whether used for casual chats or workplace collaboration, Hangouts and its successors have made staying connected easier and more efficient.
