

Basics of Computer

The Basics of Computer and its Basic Operations is an important topic. Computer is Electronic Device that receives input from the user, calculates, processes the raw data into meaningful information and provides the desired results as output. Basically, it has the capability to transform Data. The computer was invented by Charles Babbage. One should wonder how a machine can perform so many varieties of tasks so efficiently. Let us learn about the basics of a computer and its operation, features, parts, etc.

Some of the basic operations done by the computer are:

Accept/Input Data

This refers to collecting the data and instructions being given by the user. It can also be termed as **Data Capturing**.

Data Storage

The data is required to be stored at various levels while processing, before processing, or even after processing to store desired results. This is data storage.

Data Processing

This refers to processing the given data according to the given instructions and producing the required output.

Displaying the Calculated Results

This refers to producing the output on the output devices once the result is calculated.
