1. GETTING STARTED

This chapter teaches you how to start an excel 2010 application in simple steps. Assuming you have Microsoft Office 2010 installed in your PC, start the excel application following the below mentioned steps in your PC.

Step 1: Click on the **Start** button.

Step 2: Click on **All Programs** option from the menu.

Excel 2010

All Programs

Step 3: Search for **Microsoft Office** from the sub menu and click it.

Microsoft Office

Step 4: Search for **Microsoft Excel 2010** from the submenu and click it.

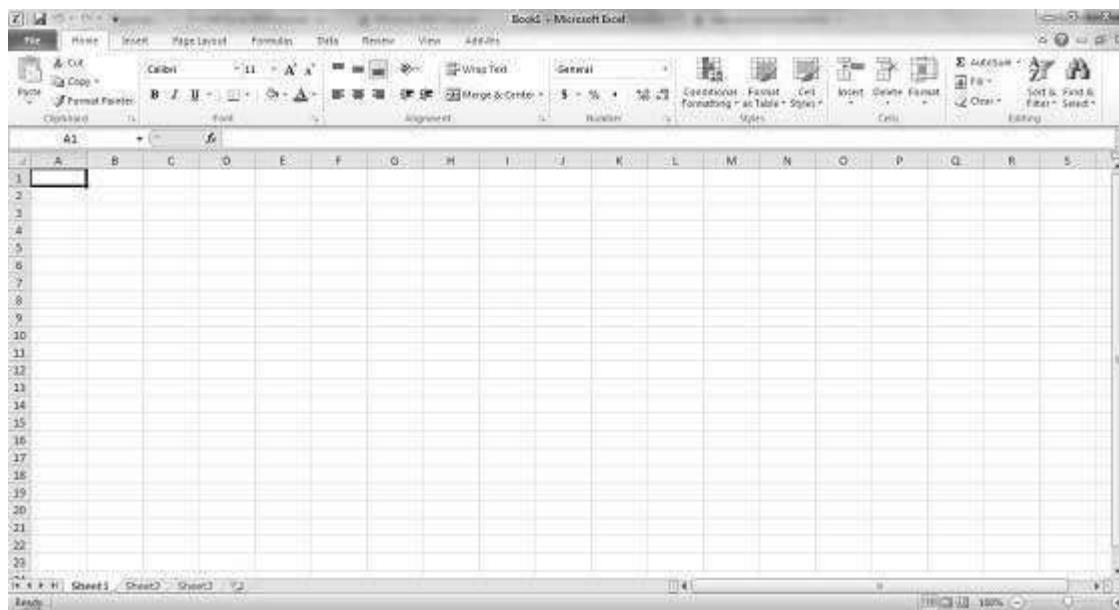

Excel 2010

2. EXPLORE WINDOW

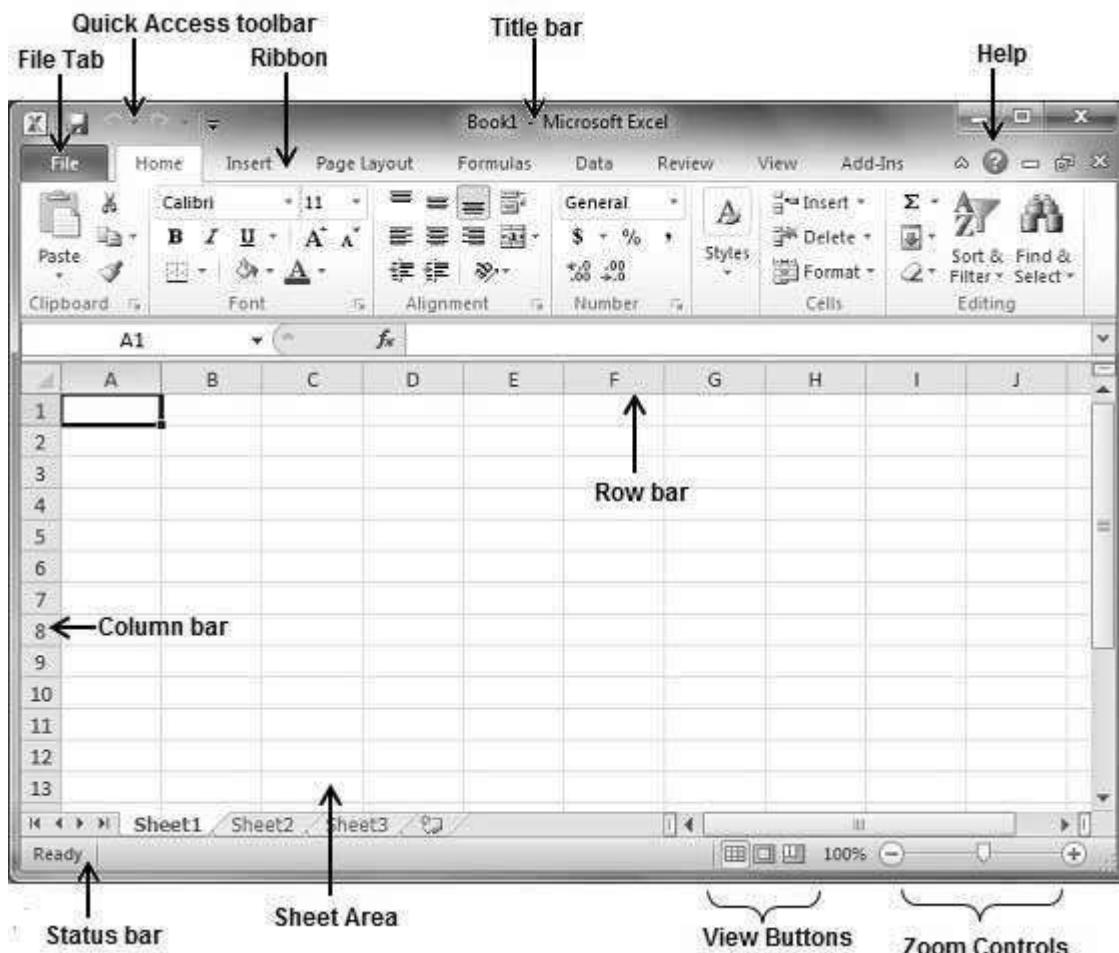

Microsoft Excel 2010

This will launch the Microsoft Excel 2010 application and you will see the following excel window.

The following basic window appears when you start the excel application. Let us now understand the various important parts of this window.

File Tab

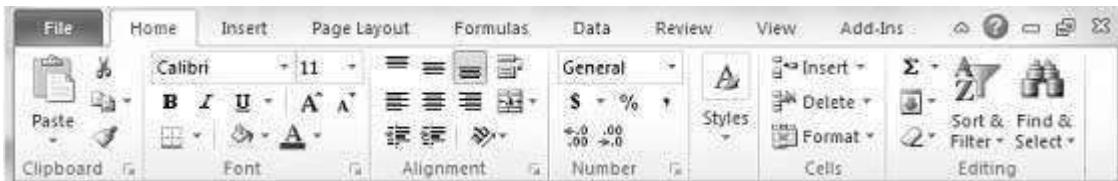

The File tab replaces the Office button from Excel 2007. You can click it to check the **Backstage view**, where you come to open or save files, create new sheets, print a sheet, and do other file-related operations.

Quick Access Toolbar

You will find this toolbar just above the **File tab** and its purpose is to provide a convenient resting place for the Excel's most frequently used commands. You can customize this toolbar based on your comfort.

Excel 2010

Ribbon

Ribbon contains commands organized in three components:

- **Tabs:** They appear across the top of the Ribbon and contain groups of related commands. Home, Insert, Page Layout are the examples of ribbon tabs.
- **Groups:** They organize related commands; each group name appears below the group on the Ribbon. For example, group of commands related to fonts or group of commands related to alignment etc.
- **Commands:** Commands appear within each group as mentioned above.

Title Bar

This lies in the middle and at the top of the window. Title bar shows the program and the sheet titles.

Help

The **Help Icon** can be used to get excel related help anytime you like. This provides nice tutorial on various subjects related to excel.

Zoom Control

Zoom control lets you zoom in for a closer look at your text. The zoom control consists of a slider that you can slide left or right to zoom in or out. The + buttons can be clicked to increase or decrease the zoom factor.

View Buttons

The group of three buttons located to the left of the Zoom control, near the bottom of the screen, lets you switch among excel's various sheet views.

- **Normal Layout view:** This displays the page in normal view.
- **Page Layout view:** This displays pages exactly as they will appear when printed. This gives a full screen look of the document.
- **Page Break view:** This shows a preview of where pages will break when printed.

Sheet Area

The area where you enter data. The flashing vertical bar is called the **insertion point** and it represents the location where text will appear when you type.

Row Bar

Rows are numbered from 1 onwards and keeps on increasing as you keep entering data. Maximum limit is 1,048,576 rows.

Column Bar

Columns are numbered from A onwards and keeps on increasing as you keep entering data. After Z, it will start the series of AA, AB and so on. Maximum limit is 16,384 columns.

Status Bar

This displays the sheet information as well as the insertion point location. From left to right, this bar can contain the total number of pages and words in the document, language etc.

You can configure the status bar by right-clicking anywhere on it and by selecting or deselecting options from the provided list.

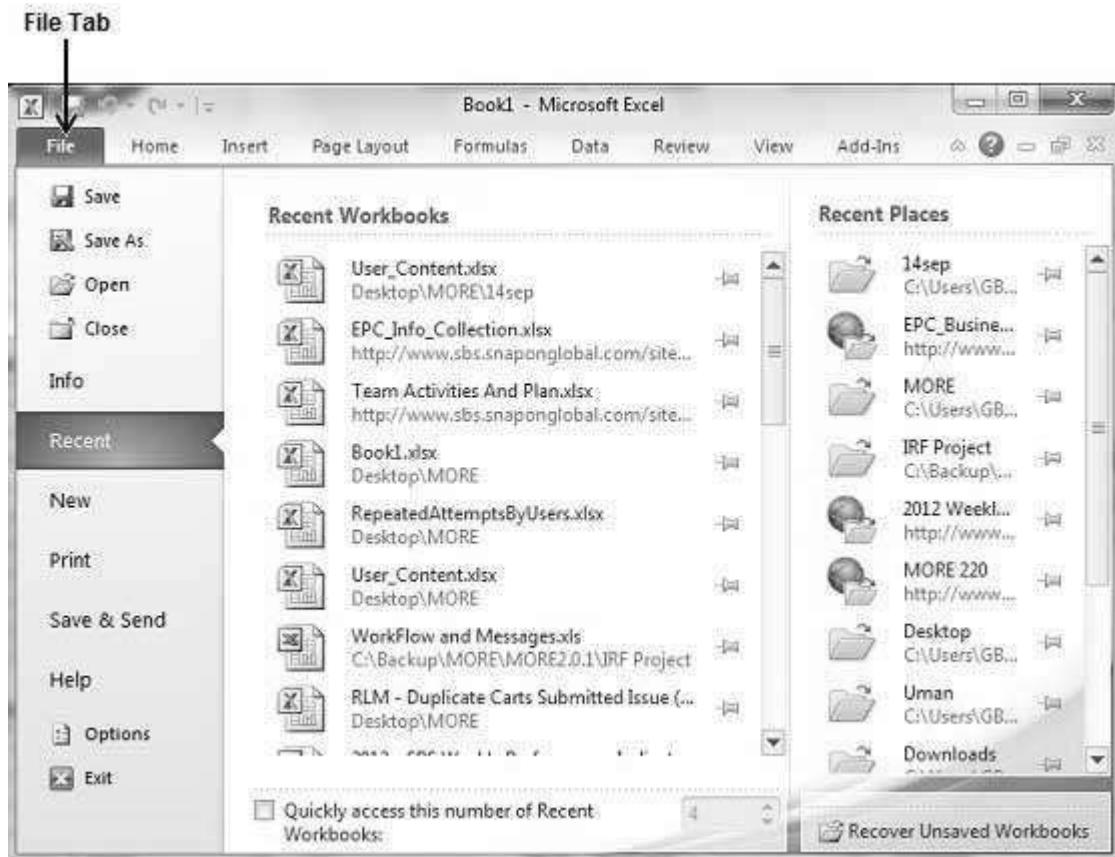

Dialog Box Launcher

This appears as a very small arrow in the lower-right corner of many groups on the Ribbon. Clicking this button opens a dialog box or task pane that provides more options about the group.

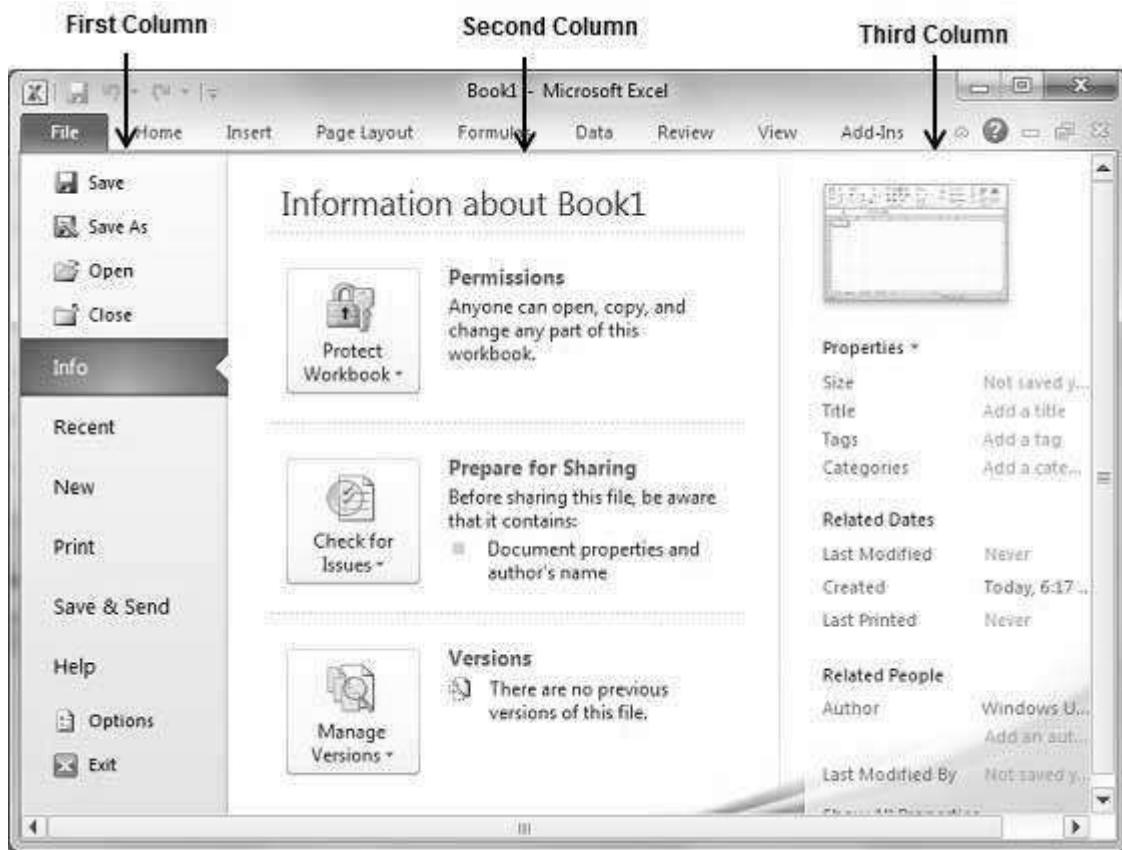

The **Backstage view** has been introduced in Excel 2010 and acts as the central place for managing your sheets. The backstage view helps in - creating new sheets, saving and opening sheets, printing and sharing sheets, and so on.

3. BACKSTAGE

Getting to the Backstage View is easy. Just click the **File tab** located in the upper-left corner of the Excel Ribbon. If you already do not have any opened sheet then you will see a window listing down all the recently opened sheets as follows:

If you already have an opened sheet then it will display a window showing the details about the opened sheet as shown below. Backstage view shows three columns when you select most of the available options in the first column.

First column of the backstage view will have the following options:

Option	Description
Save	If an existing sheet is opened, it would be saved as is, otherwise it will display a dialogue box asking for the sheet name.
Save As	A dialogue box will be displayed asking for sheet name and sheet type. By default, it will save in sheet 2010 format with extension .xlsx.
Open	This option is used to open an existing excel sheet.
Close	This option is used to close an opened sheet.
Info	This option displays the information about the opened sheet.

Recent	This option lists down all the recently opened sheets.
--------	--

Excel 2010

New	This option is used to open a new sheet.
Print	This option is used to print an opened sheet.
Save & Send	This option saves an opened sheet and displays options to send the sheet using email etc.
Help	You can use this option to get the required help about excel 2010.
Options	Use this option to set various option related to excel 2010.
Exit	Use this option to close the sheet and exit.

Sheet Information

When you click **Info** option available in the first column, it displays the following information in the second column of the backstage view:

- **Compatibility Mode:** If the sheet is not a native excel 2007/2010 sheet, a Convert button appears here, enabling you to easily update its format. Otherwise, this category does not appear.
- **Permissions:** You can use this option to protect the excel sheet. You can set a password so that nobody can open your sheet, or you can lock the sheet so that nobody can edit your sheet.
- **Prepare for Sharing:** This section highlights important information you should know about your sheet before you send it to others, such as a record of the edits you made as you developed the sheet.
- **Versions:** If the sheet has been saved several times, you may be able to access previous versions of it from this section.

Sheet Properties

When you click **Info** option available in the first column, it displays various properties in the third column of the backstage view. These properties include sheet size, title, tags, categories etc.

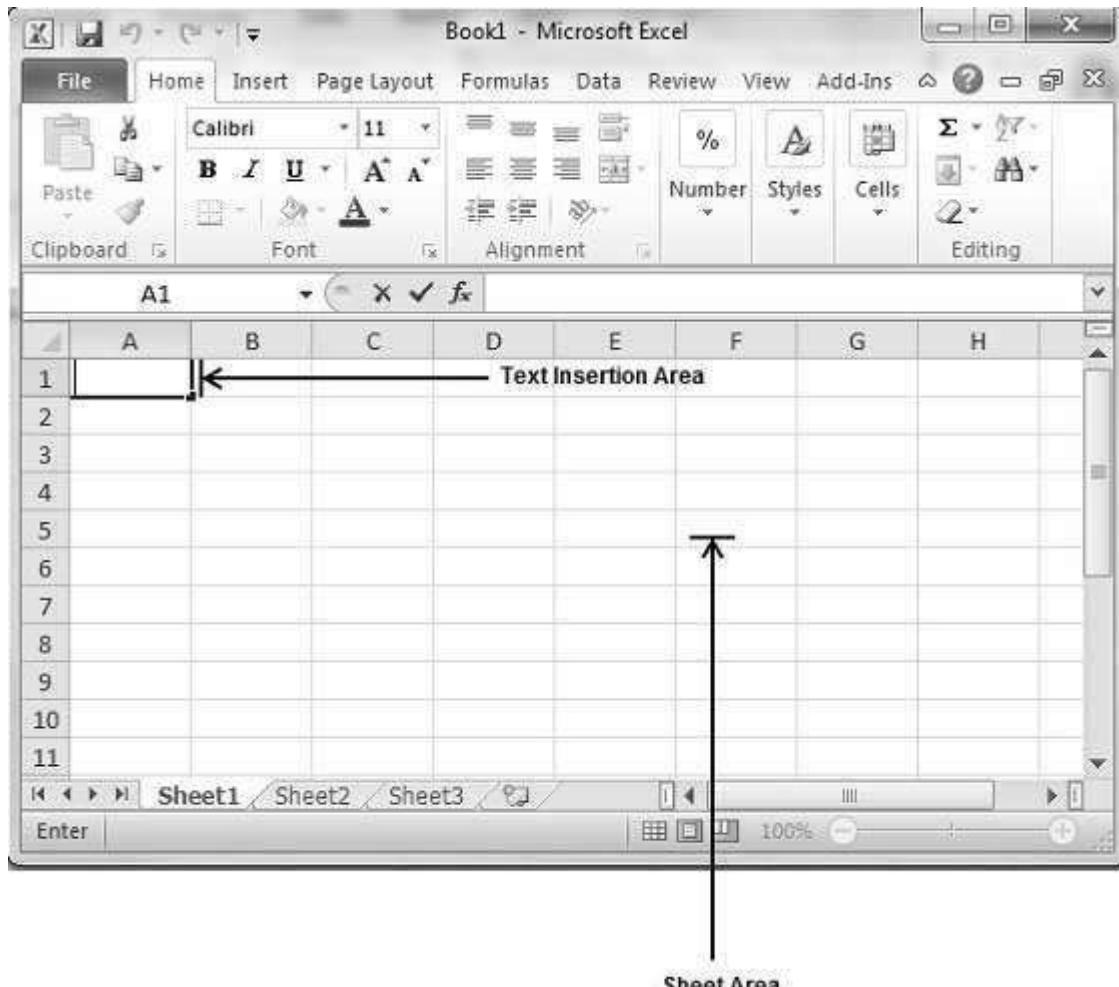

You can also edit various properties. Just try to click on the property value and if property is editable, then it will display a text box where you can add your text like title, tags, comments, Author.

Exit Backstage View

It is simple to exit from the Backstage View. Either click on the **File tab** or press the Esc button on the keyboard to go back to excel working mode.

4. ENTERING VALUES

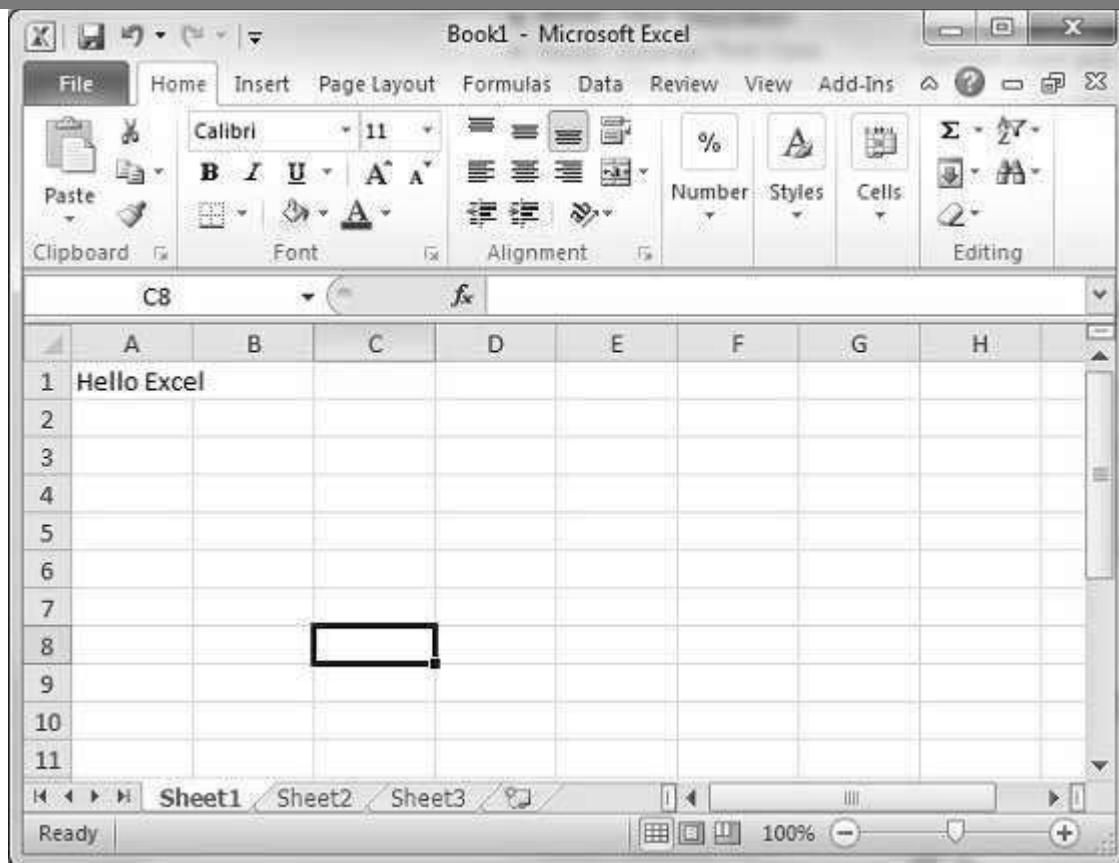

Entering values in excel sheet is a child's play and this chapter shows how to enter values in an excel sheet. A new sheet is displayed by default when you open an excel sheet as shown in the below screen shot.

Sheet area is the place where you type your text. The flashing vertical bar is called the insertion point and it represents the location where text will appear when you type. When you click on a box then the box is highlighted. When you double click the box, the flashing vertical bar appears and you can start entering your data.

So, just keep your mouse cursor at the text insertion point and start typing whatever text you would like to type. We have typed only two words "Hello Excel" as shown below. The text appears to the left of the insertion point as you type.

5. MOVE AROUND

There are following three important points, which would help you while typing:

- Press Tab to go to next column.
- Press Enter to go to next row.
- Press Alt + Enter to enter a new line in the same column.

Excel provides a number of ways to move around a sheet using the mouse and the keyboard.

First of all, let us create some sample text before we proceed. Open a new excel sheet and type any data. We've shown a sample data in the screenshot.

OrderDate	Region	Rep	Item	Units	Unit Cost	Total
1/6/2010	East	Jones	Pencil	95	1.99	189.05

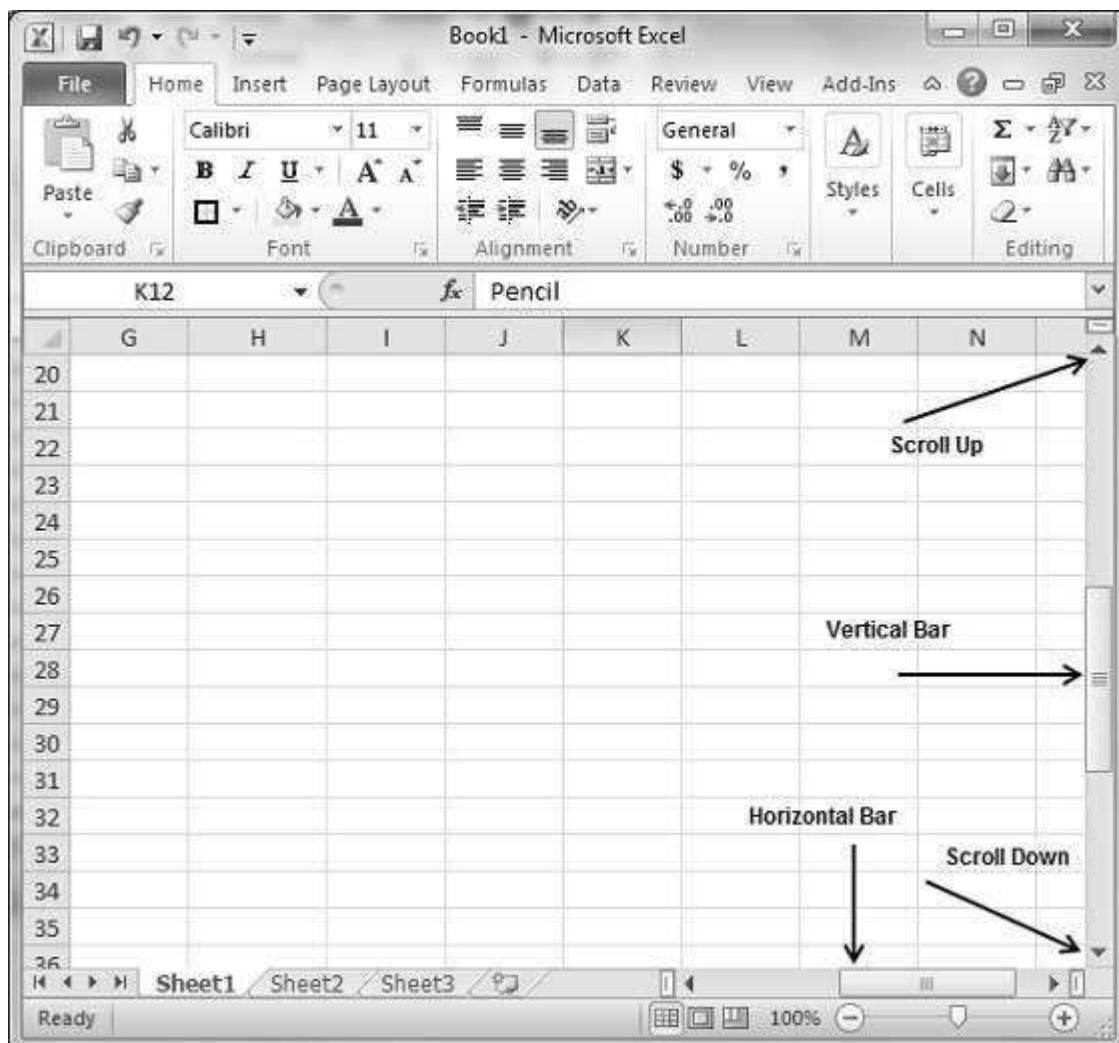

1/23/2010	Central	Kivell	Binder	50	19.99	999.5
2/9/2010	Central	Jardine	Pencil	36	4.99	179.64
2/26/2010	Central	Gill	Pen	27	19.99	539.73
3/15/2010	West	Sorvino	Pencil	56	2.99	167.44
4/1/2010	East	Jones	Binder	60	4.99	299.4
4/18/2010	Central	Andrews	Pencil	75	1.99	149.25
5/5/2010	Central	Jardine	Pencil	90	4.99	449.1
5/22/2010	West	Thompson	Pencil	32	1.99	63.68
6/8/2010	East	Jones	Binder	60	8.99	539.4
6/25/2010	Central	Morgan	Pencil	90	4.99	449.1
7/12/2010	East	Howard	Binder	29	1.99	57.71
7/29/2010	East	Parent	Binder	81	19.99	1,619.19
8/15/2010	East	Jones	Pencil	35	4.99	174.65

The screenshot shows a Microsoft Excel window titled "Book1 - Microsoft Excel". The ribbon menu is visible at the top with tabs like File, Home, Insert, Page Layout, Formulas, Data, Review, View, Add-Ins, etc. The "Home" tab is selected. Below the ribbon is the formula bar with "K12" and "Pencil". The main area is a data table with columns: OrderDate, Region, Rep, Item, Units, Unit Cost, and Total. The data rows show various purchases from different regions by different sales representatives. The table starts at row 5 and ends at row 19. The last row (row 19) has a formula in the "Total" column: =B19*C19. The status bar at the bottom shows "Ready" and "100%".

	G	H	I	J	K	L	M	N
4								
5	OrderDate	Region	Rep	Item	Units	Unit Cost	Total	
6	1/6/2010	East	Jones	Pencil	95	1.99	189.05	
7	1/23/2010	Central	Kivell	Binder	50	19.99	999.5	
8	2/9/2010	Central	Jardine	Pencil	36	4.99	179.64	
9	2/26/2010	Central	Gill	Pen	27	19.99	539.73	
10	3/15/2010	West	Sorvino	Pencil	56	2.99	167.44	
11	4/1/2010	East	Jones	Binder	60	4.99	299.4	
12	4/18/2010	Central	Andrews	Pencil	75	1.99	149.25	
13	5/5/2010	Central	Jardine	Pencil	90	4.99	449.1	
14	5/22/2010	West	Thompson	Pencil	32	1.99	63.68	
15	6/8/2010	East	Jones	Binder	60	8.99	539.4	
16	6/25/2010	Central	Morgan	Pencil	90	4.99	449.1	
17	7/12/2010	East	Howard	Binder	29	1.99	57.71	
18	7/29/2010	East	Parent	Binder	81	19.99	1,619.19	
19	8/15/2010	East	Jones	Pencil	35	4.99	174.65	

Moving with Mouse

You can easily move the insertion point by clicking in your text anywhere on the screen. Sometime if the sheet is big then you cannot see a place where you want to move. In such situations, you would have to use the scroll bars, as shown in the following screen shot:

You can scroll your sheet by rolling your mouse wheel, which is equivalent to clicking the up-arrow or down-arrow buttons in the scroll bar.

Moving with Scroll Bars

As shown in the above screen capture, there are two scroll bars: one for moving vertically within the sheet, and one for moving horizontally. Using the vertical scroll bar, you may:

- Move upward by one line by clicking the upward-pointing scroll arrow.
- Move downward by one line by clicking the downward-pointing scroll arrow.
- Move one next page, using next page button (footnote).
- Move one previous page, using previous page button (footnote).

- Use **Browse Object** button to move through the sheet, going from one chosen object to the next.

Moving with Keyboard

The following keyboard commands, used for moving around your sheet, also move the insertion point:

Keystroke	Where the Insertion Point Moves
→	Forward one box
←	Back one box
↑	Up one box
↓	Down one box
PageUp	To the previous screen
PageDown	To the next screen
Home	To the beginning of the current screen
End	To the end of the current screen

You can move box by box or sheet by sheet. Now click in any box containing data in the sheet. You would have to hold down the Ctrl key while pressing an arrow key, which moves the insertion point as described here:

Key Combination	Where the Insertion Point Moves
Ctrl + →	To the last box containing data of the current row.
Ctrl + ←	To the first box containing data of the current row.
Ctrl + ↑	To the first box containing data of the current column.
Ctrl + ↓	To the last box containing data of the current column.
Ctrl + PageUp	To the sheet in the left of the current sheet.
Ctrl + PageDown	To the sheet in the right of the current sheet.
Ctrl + Home	To the beginning of the sheet.
Ctrl + End	To the end of the sheet.

Moving with Go To Command

Press **F5** key to use Go To command, which will display a dialogue box where you will find various options to reach to a particular box.

Normally, we use row and column number, for example K5 and finally press **Go To** button.

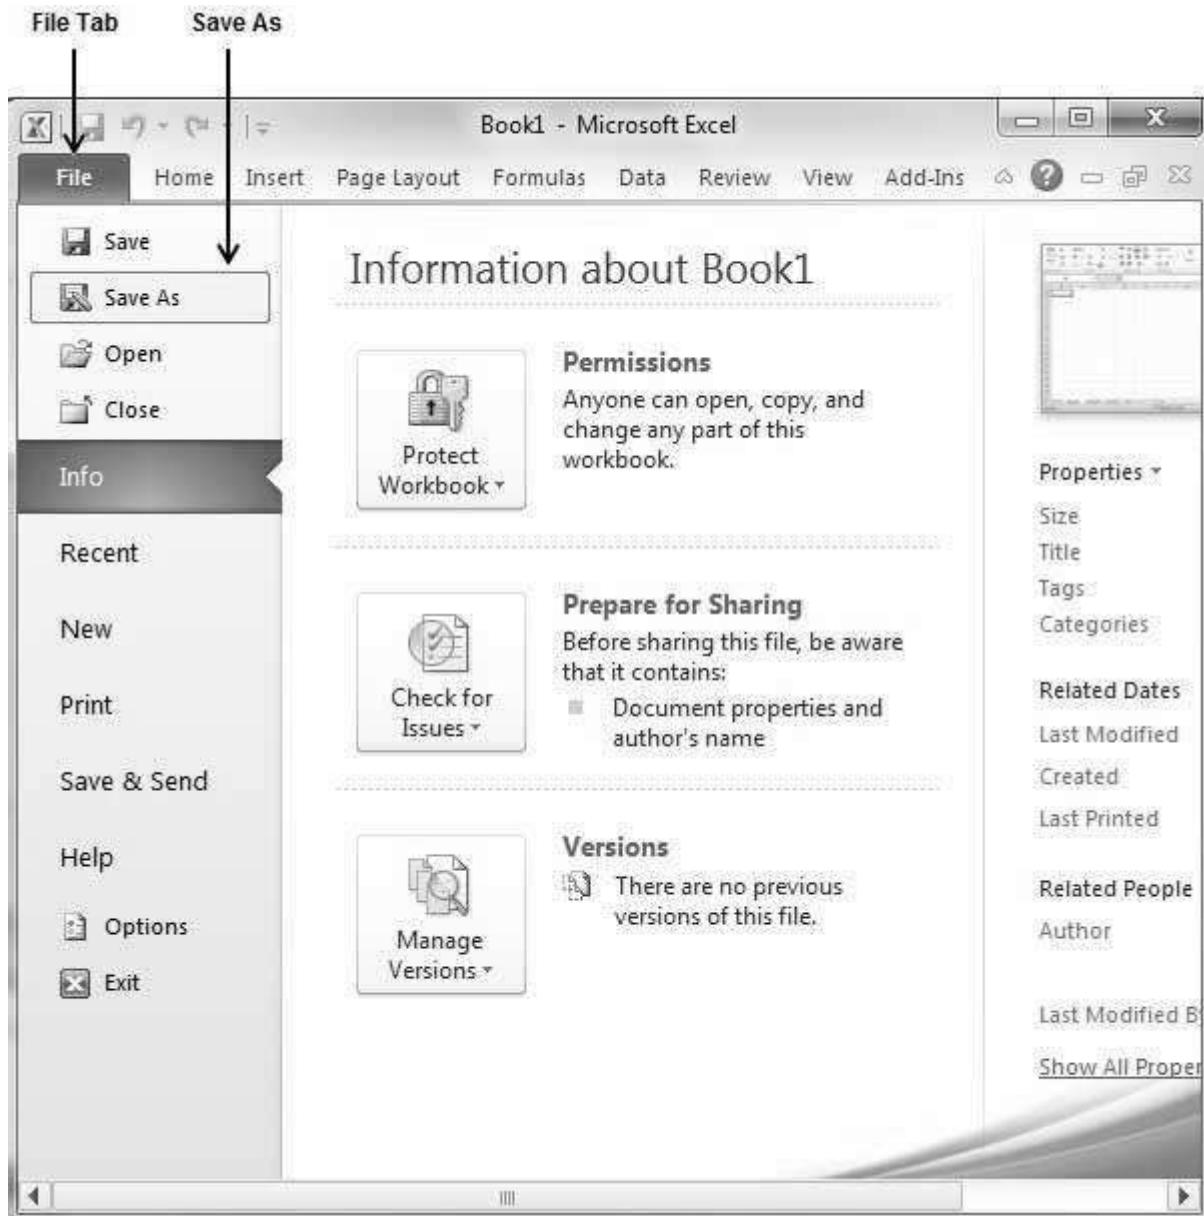

6. SAVE WORKBOOK

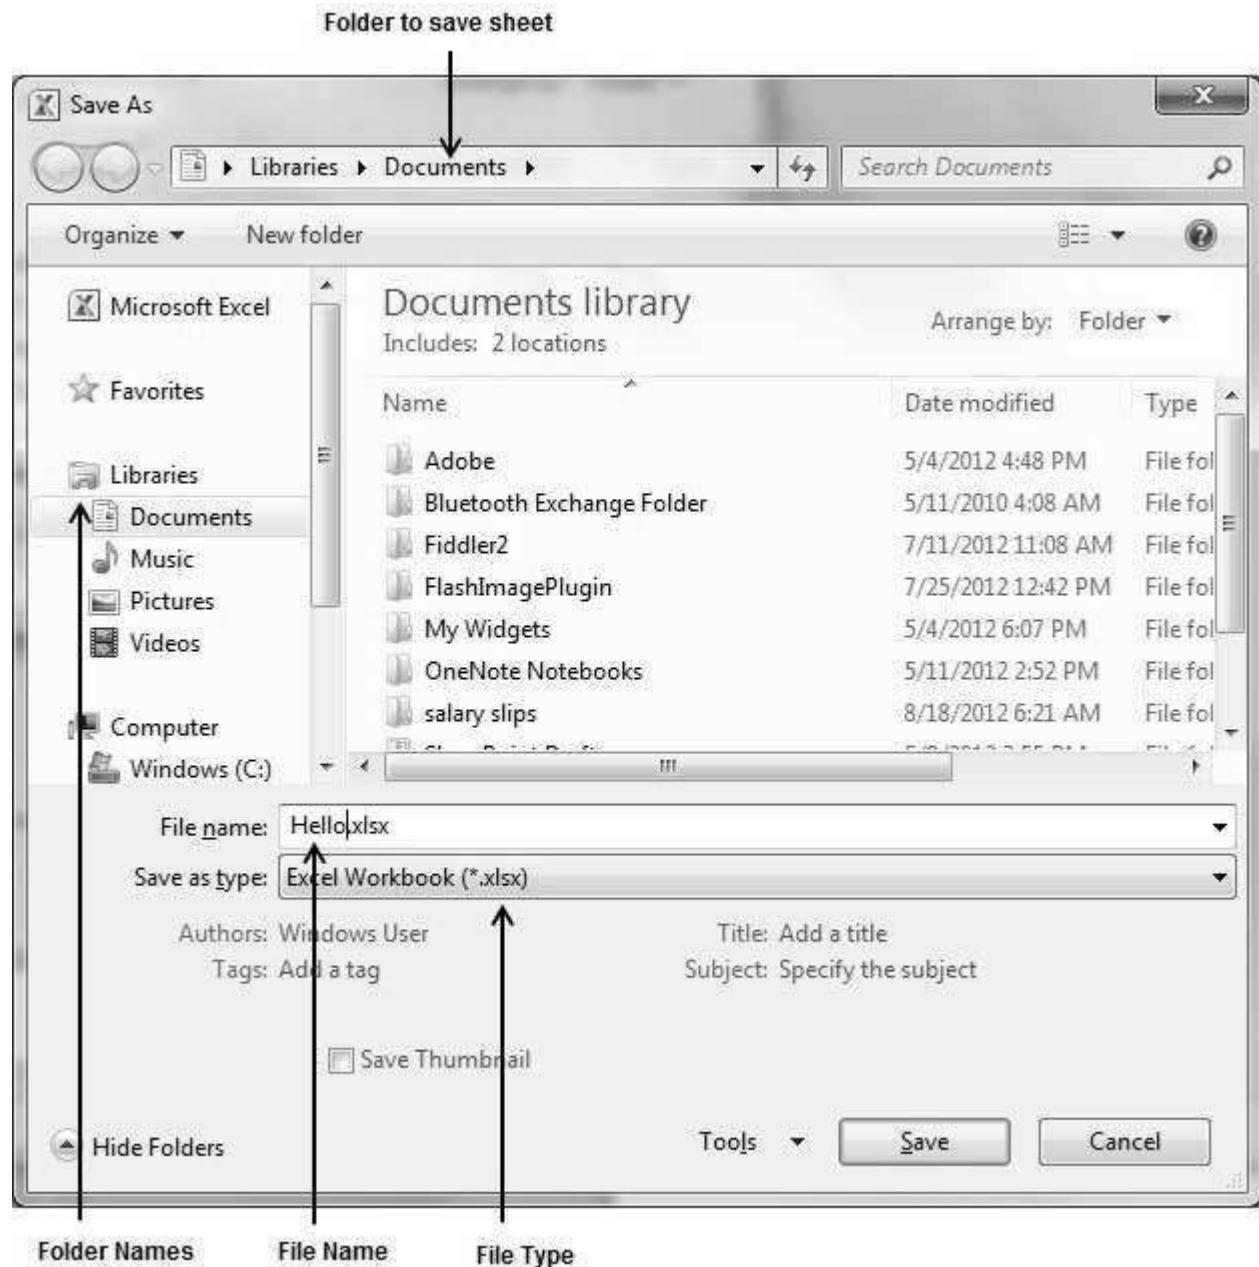

Saving New Sheet

Once you are done with typing in your new excel sheet, it is time to save your sheet/workbook to avoid losing work you have done on an Excel sheet. Following are the steps to save an edited excel sheet:

Step 1: Click the **File tab** and select **Save As** option.

Step 2: Select a folder where you would like to save the sheet, Enter file name, which you want to give to your sheet and Select a Save as type, by default it is **.docx** format.

Step 3: Finally, click on **Save** button and your sheet will be saved with the entered name in the selected folder.

Saving New Changes

There may be a situation when you open an existing sheet and edit it partially or completely, or even you would like to save the changes in between editing of the

sheet. If you want to save this sheet with the same name, then you can use either of the following simple options:

- Just press **Ctrl + S** keys to save the changes.
- Optionally, you can click on the floppy icon available at the top left corner and just above the **File tab**. This option will also save the changes.
- You can also use third method to save the changes, which is the **Save** option available just above the **Save As** option, as shown in the above screen capture.

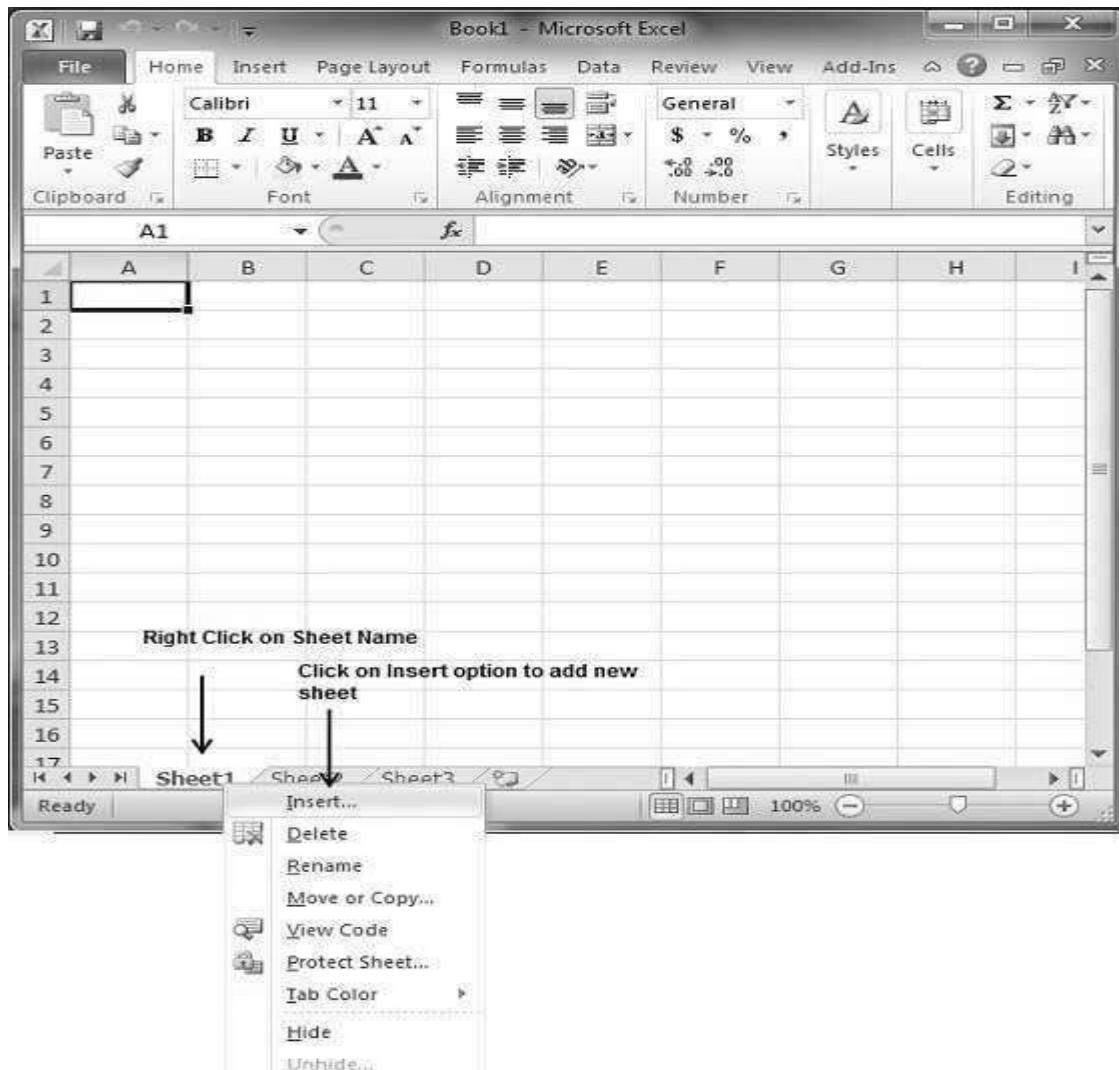

If your sheet is new and it was never saved so far, then with either of the three options, word would display you a dialogue box to let you select a folder, and enter sheet name as explained in case of saving new sheet.

7. CREATE WORKSHEET

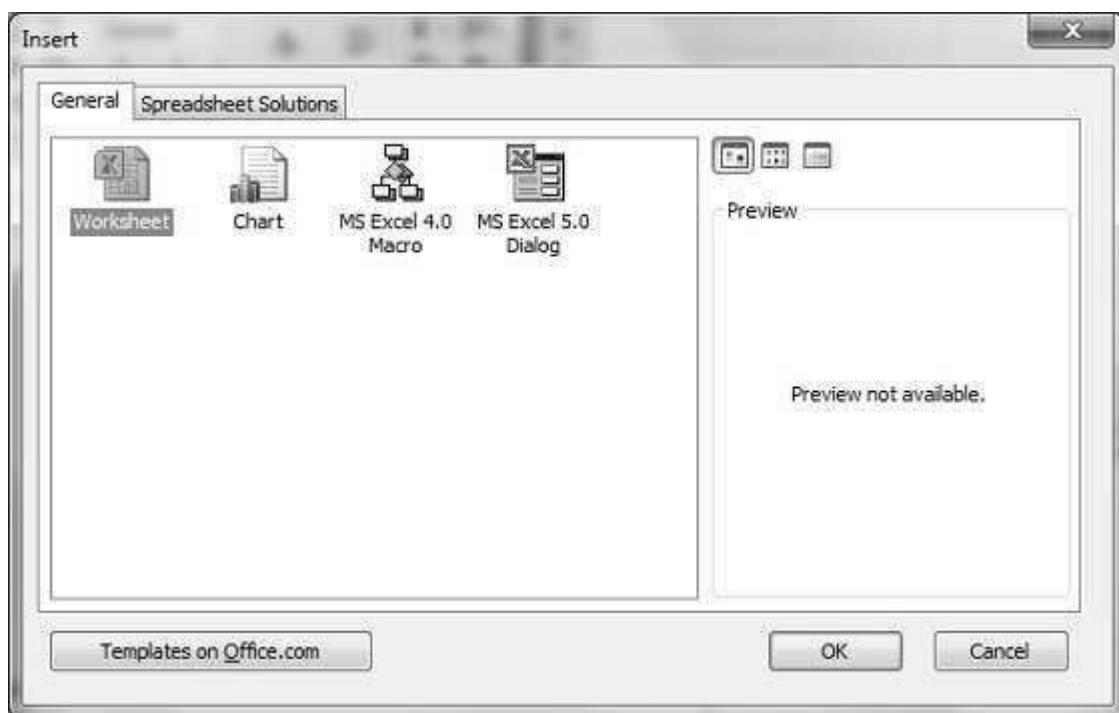

Creating New Worksheet

Three new blank sheets always open when you start Microsoft Excel. Below steps explain you how to create a new worksheet if you want to start another new worksheet while you are working on a worksheet, or you closed an already opened worksheet and want to start a new worksheet.

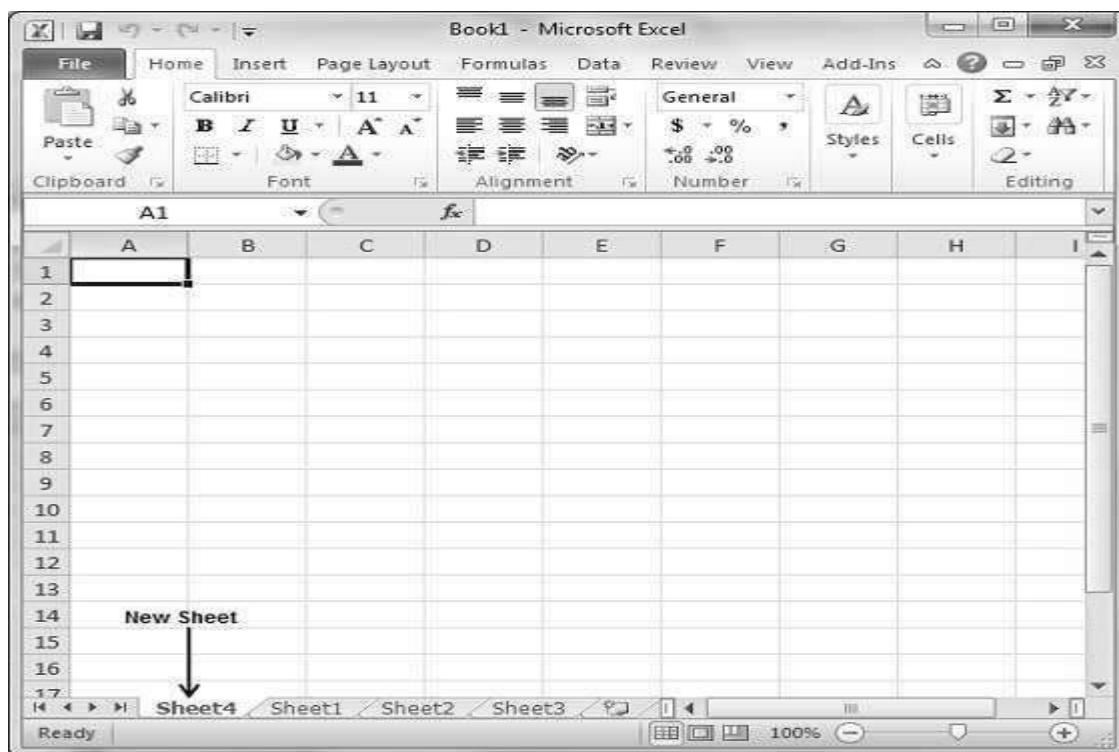

Step 1: Right Click the **Sheet Name** and select **Insert** option.

Step 2: Now you'll see the Insert dialog with select **Worksheet** option as selected from the general tab. Click the **Ok** button.

Now you should have your blank sheet as shown below ready to start typing your text.

You can use a short cut to create a blank sheet anytime. Try using the **Shift+F11** keys and you will see a new blank sheet similar to the above sheet is opened.

8. COPY WORKSHEET

Copy Worksheet

First of all, let us create some sample text before we proceed. Open a new excel sheet and type any data. We've shown a sample data in the screenshot.

OrderDate	Region	Rep	Item	Units	Unit Cost	Total
1/6/2010	East	Jones	Pencil	95	1.99	189.05
1/23/2010	Central	Kivell	Binder	50	19.99	999.5
2/9/2010	Central	Jardine	Pencil	36	4.99	179.64
2/26/2010	Central	Gill	Pen	27	19.99	539.73
3/15/2010	West	Sorvino	Pencil	56	2.99	167.44
4/1/2010	East	Jones	Binder	60	4.99	299.4
4/18/2010	Central	Andrews	Pencil	75	1.99	149.25
5/5/2010	Central	Jardine	Pencil	90	4.99	449.1
5/22/2010	West	Thompson	Pencil	32	1.99	63.68
6/8/2010	East	Jones	Binder	60	8.99	539.4
6/25/2010	Central	Morgan	Pencil	90	4.99	449.1
7/12/2010	East	Howard	Binder	29	1.99	57.71

7/29/2010	East	Parent	Binder	81	19.99	1,619.19
8/15/2010	East	Jones	Pencil	35	4.99	174.65

Book1 - Microsoft Excel

The screenshot shows a Microsoft Excel spreadsheet titled "Book1 - Microsoft Excel". The data is organized into a table with the following columns: OrderDate, Region, Rep, Item, Units, Unit Cost, and Total. The rows contain specific data points such as 1/6/2010, East, Jones, Pencil, 95, 1.99, 189.05; 1/23/2010, Central, Kivell, Binder, 50, 19.99, 999.5; and so on. The Excel interface includes a ribbon bar with tabs like File, Home, Insert, Page Layout, Formulas, Data, Review, View, Add-Ins, and a status bar at the bottom.

	G	H	I	J	K	L	M	N
4	OrderDate	Region	Rep	Item	Units	Unit Cost	Total	
5	1/6/2010	East	Jones	Pencil	95	1.99	189.05

18	8/15/2010	East	Jones	Pencil	35	4.99	174.65	
19								

Here are the steps to copy an entire worksheet.

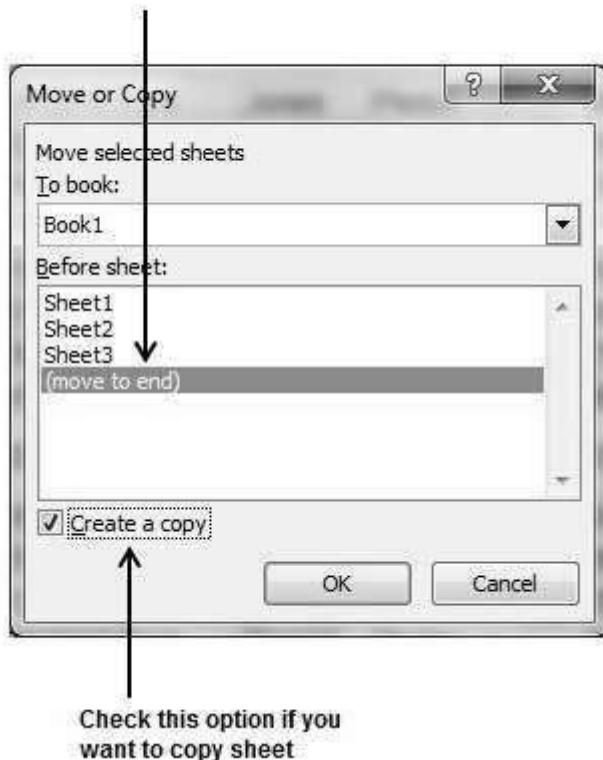

Step 1: Right Click the **Sheet Name** and select the **Move or Copy** option.

The screenshot shows a Microsoft Excel 2010 window with a data table. A right-click context menu is open over the 8th row (row 8), which contains the values '4/18/2', 'Move or Copy...', 'Pencil', '27', '19.99', and '539.73'. The menu options include 'Insert...', 'Delete', 'Rename', 'Move or Copy...', 'View Code', 'Protect Sheet...', 'Tab Color', 'Hide', 'Unhide...', and 'Select All Sheets'. A callout bubble points to the 'Move or Copy...' option with the text 'Select Move or Copy... Option'.

	A	B	C	D	E	F	G	H
1	OrderDate	Region	Rep	Item	Units	Unit Cost	Total	
2	1/6/2010	East	Jones	Pencil	95	1.99	189.05	
3	1/23/2010	Central	Kivell	Binder	50	19.99	999.5	
4	2/9/2010	Central	Jardine	Pencil	36	4.99	179.64	
5	2/26/2			Pen	27	19.99	539.73	
6	3/15/2			Pencil	56	2.99	167.44	
7	4/1/2			Binder	60	4.99	299.4	
8	4/18/2			Pencil	75	1.99	149.25	
9	5/5/2			Pencil	90	4.99	449.1	
10	5/22/2			Pencil	32	1.99	63.68	
11	6/8/2			Binder	60	8.99	539.4	
12	6/25/2			Pencil	90	4.99	449.1	
13	7/12/2			Binder	29	1.99	57.71	
14	7/29/2			Binder	81	19.99	1,619.19	

Step 2: Now you'll see the Move or Copy dialog with select **Worksheet** option as selected from the general tab. Click the **Ok** button.

Select option to add sheet at end

Select **Create a Copy** Checkbox to create a copy of the current sheet and **Before sheet** option as **(move to end)** so that new sheet gets created at the end.

Press the **Ok** Button.

Now you should have your copied sheet as shown below.

	A	B	C	D	E	F	G	H
1	OrderDate	Region	Rep	Item	Units	Unit Cost	Total	
2	1/6/2010	East	Jones	Pencil	95	1.99	189.05	
3	1/23/2010	Central	Kivell	Binder	50	19.99	999.5	
4	2/9/2010	Central	Jardine	Pencil	36	4.99	179.64	
5	2/26/2010	Central	Gill	Pen	27	19.99	539.73	
6	3/15/2010	West	Sorvino	Pencil	56	2.99	167.44	
7	4/1/2010	East	Jones	Binder	60	4.99	299.4	
8	4/18/2010	Central	Andrews	Pencil	75	1.99	149.25	
9	5/5/2010	Central	Jardine	Pencil	90	4.99	449.1	
10	5/22/2010	West	Thompson	Pencil	32	1.99	63.68	
11	6/8/2010	East	Jones	Binder	60	8.99	539.4	
12	6/25/2010	Central	Morgan	Pencil	90	4.99	449.1	
13	7/12/2010	East	Howard	Binder	29	1.99	57.71	
14	7/29/2010	East	Parent	Binder	81	19.99	1,619.19	
15	8/15/2010	East	Jones	Pencil	35	4.99	174.65	

You can rename the sheet by double clicking on it. On double click, the sheet name becomes editable. Enter any name say Sheet5 and press Tab or Enter Key.

Hiding Worksheet

Here is the step to hide a worksheet.

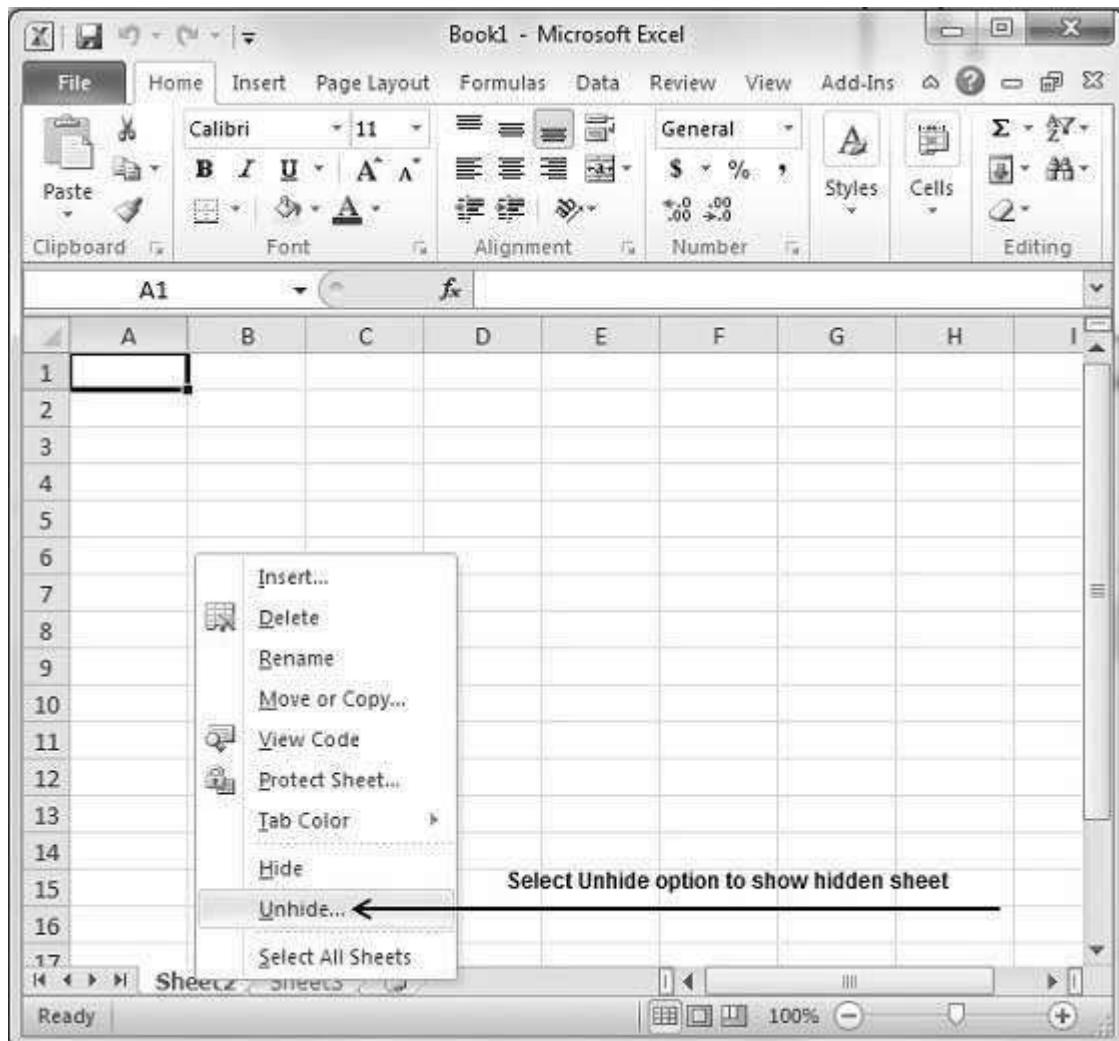

Step: Right Click the **Sheet Name** and select the **Hide** option. Sheet will get hidden.

Unhiding Worksheet

Here are the steps to unhide a worksheet.

Step 1: Right Click on any **Sheet Name** and select the **Unhide...** option.

Step 2: Select **Sheet Name** to unhide in **Unhide** dialog to unhide the sheet.

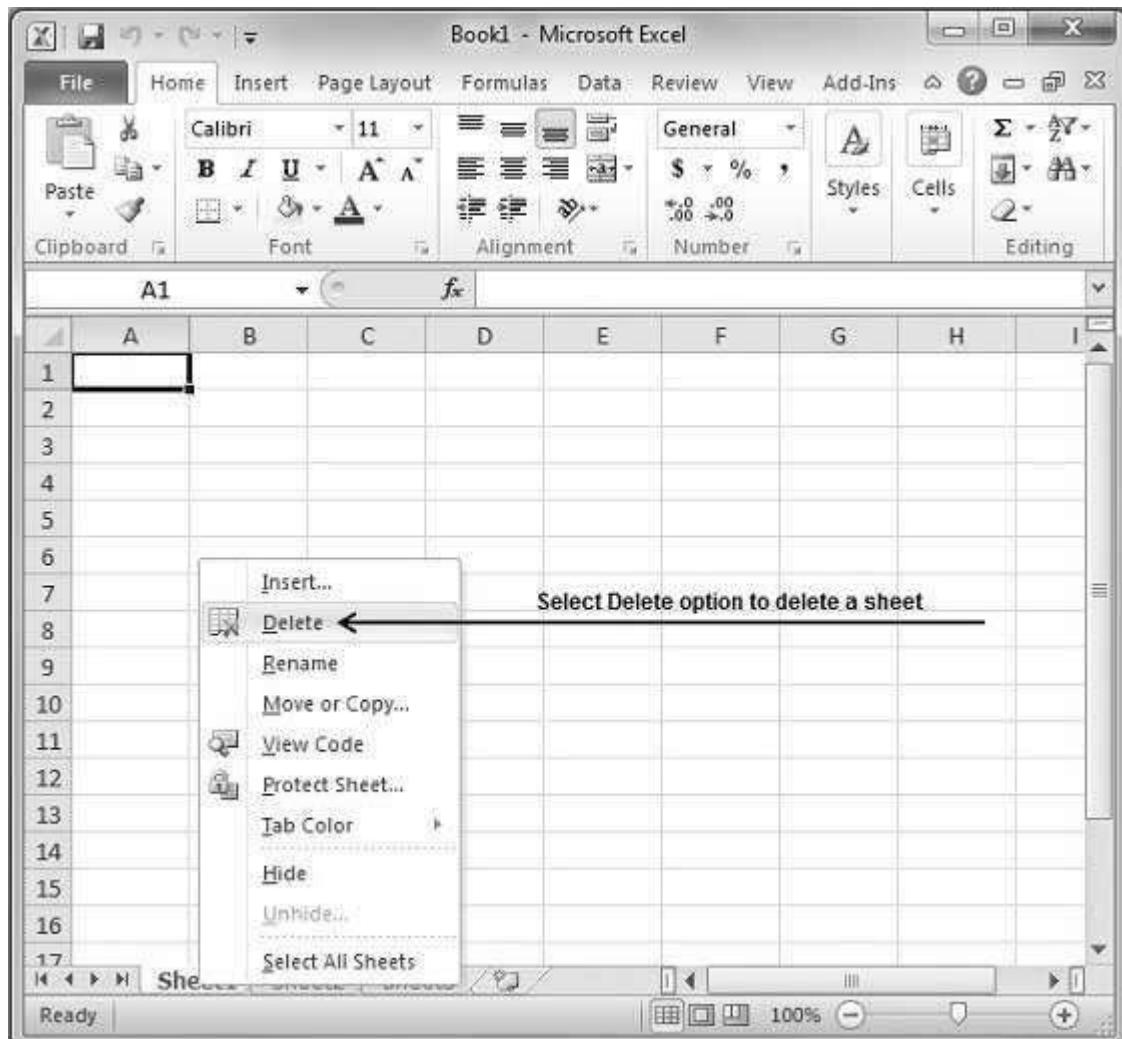

Press the **Ok** Button.

Now you will have your hidden sheet back.

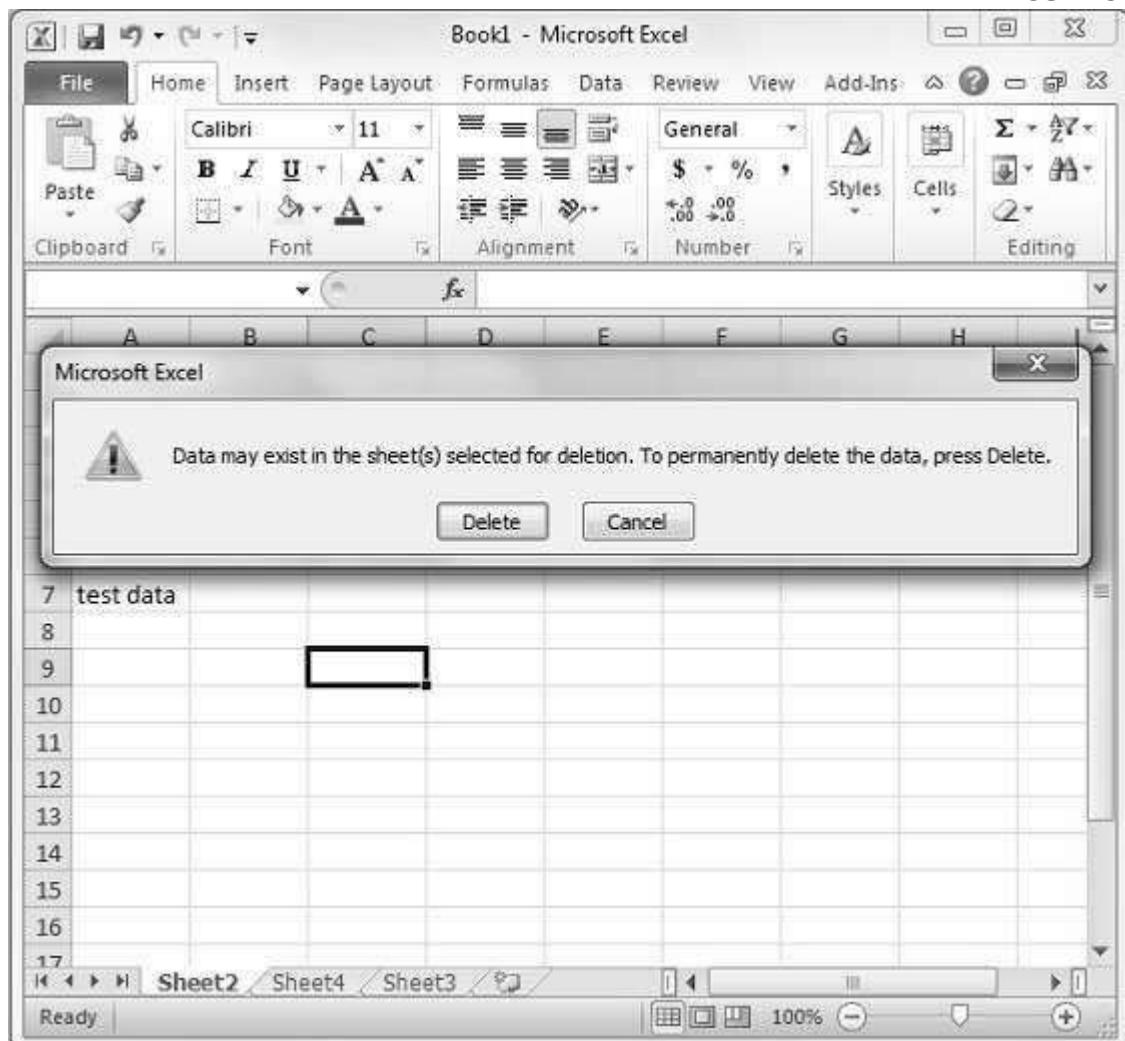

Delete Worksheet

Here is the step to delete a worksheet.

Step: Right Click the **Sheet Name** and select the **Delete** option.

Sheet will get deleted if it is empty, otherwise you'll see a confirmation message.

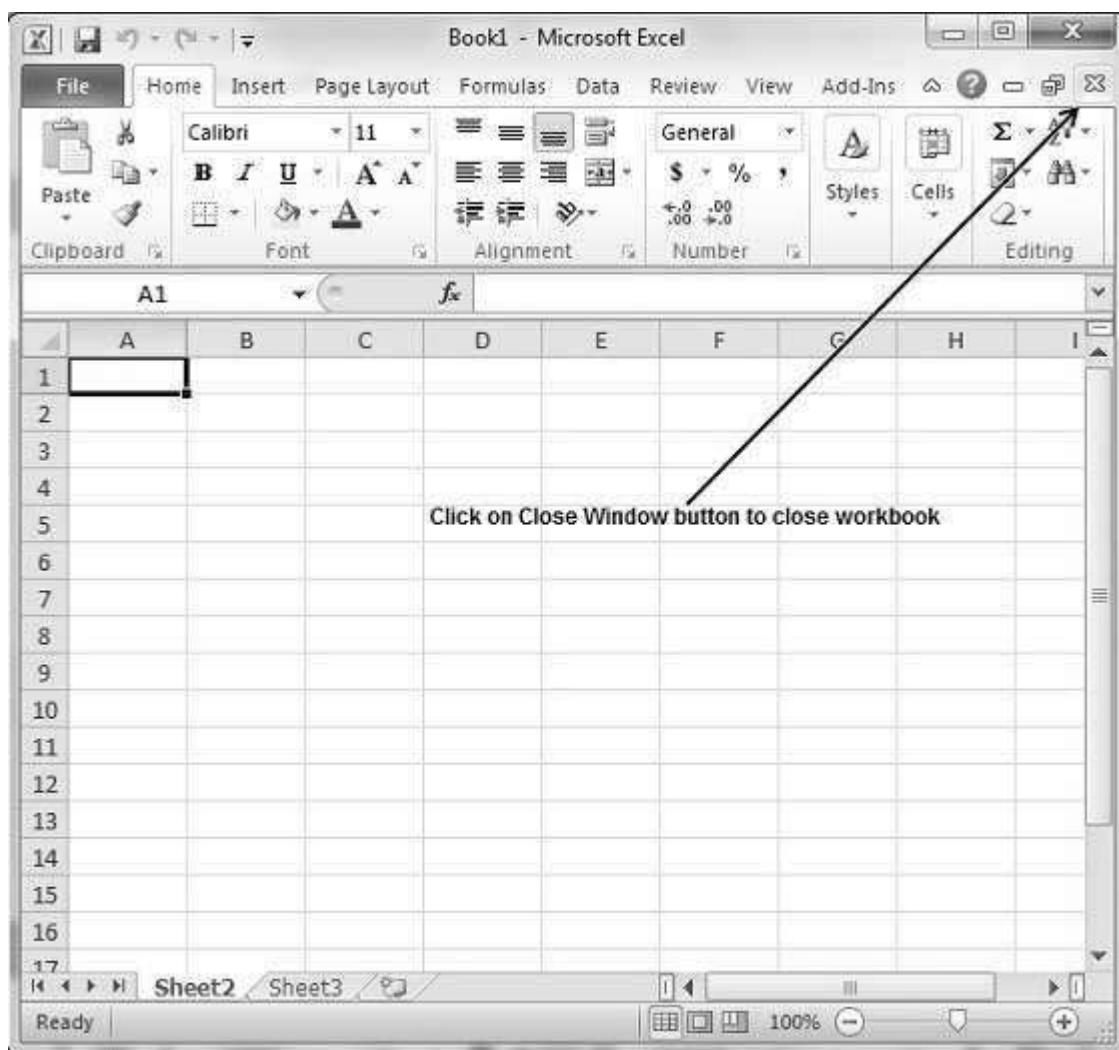

Press the Delete Button.

Now your worksheet will get deleted.

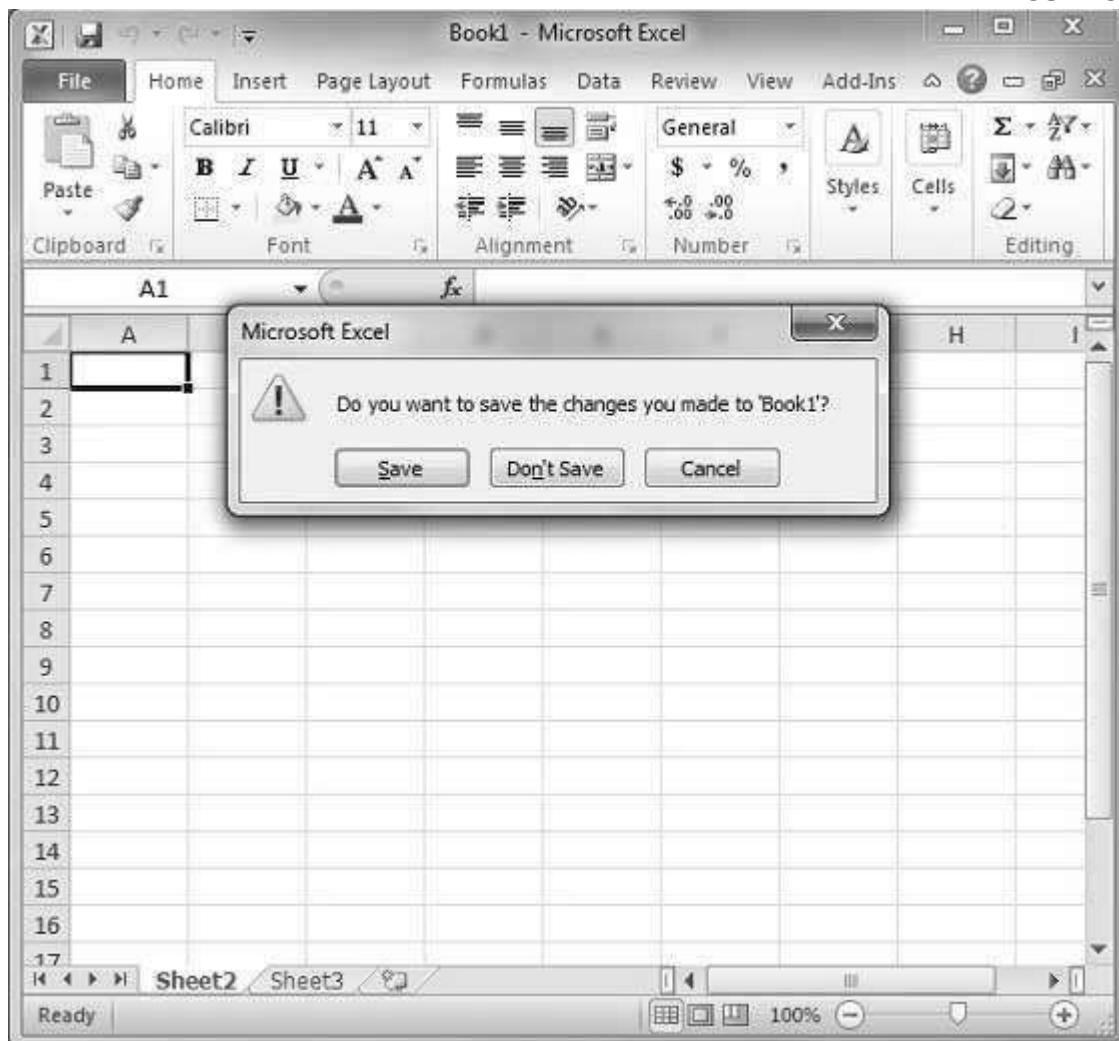

Close Workbook

Here are the steps to close a workbook.

Step 1: Click the **Close Button** as shown below.

You'll see a confirmation message to save the workbook.

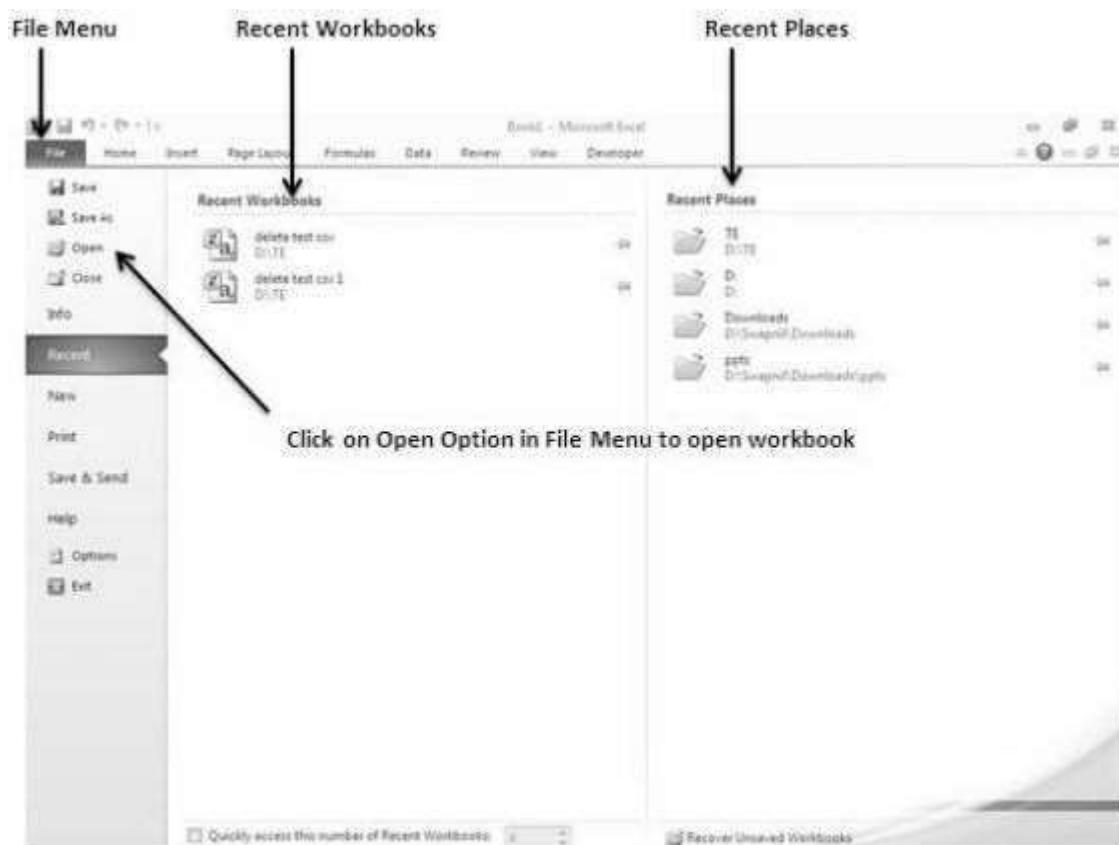

Step 2: Press the **Save** Button to save the workbook as we did in MS Excel - Save Workbook chapter.

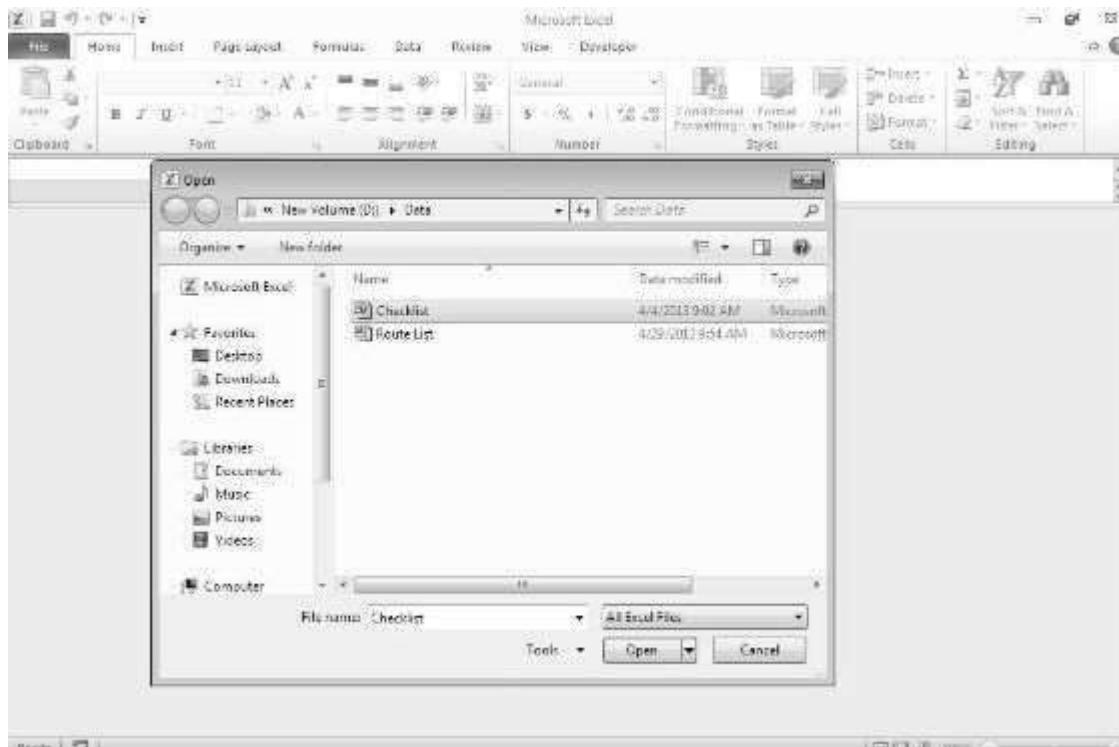

Now your worksheet will get closed.

Let us see how to open workbook from excel in the below mentioned steps.

Step 1: Click the File Menu as shown below. You can see the **Open** option in File Menu. There are two more columns - Recent workbooks and Recent places, where you can see the recently opened workbooks and the recent places from where workbooks are opened.

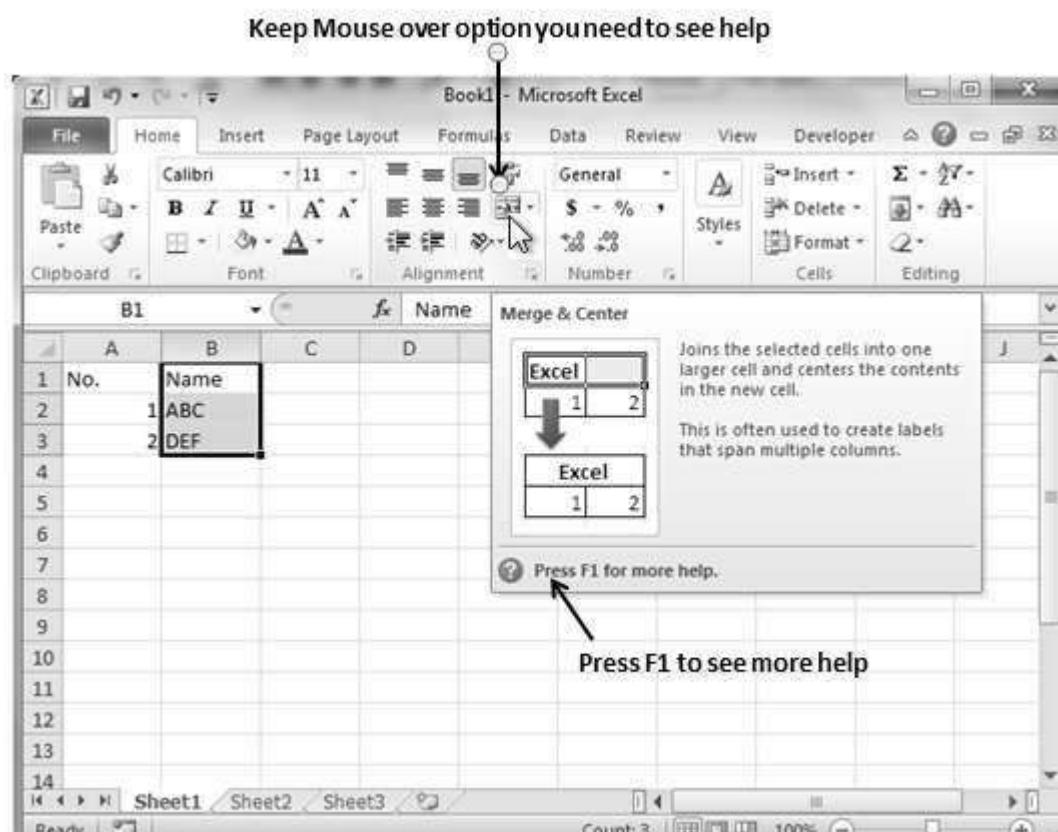

Step 2: Clicking the **Open Option** will open the browse dialog as shown below. Browse the directory and find the file you need to open.

Step 3: Once you select the workbook, your workbook will be opened as below:

Checklist Compatibility Mode - Microsoft Excel

MS Excel provides context sensitive help on mouse over. To see context sensitive help for a particular Menu option, hover the mouse over the option for some time. Then you can see the context sensitive Help as shown below.

Getting More Help

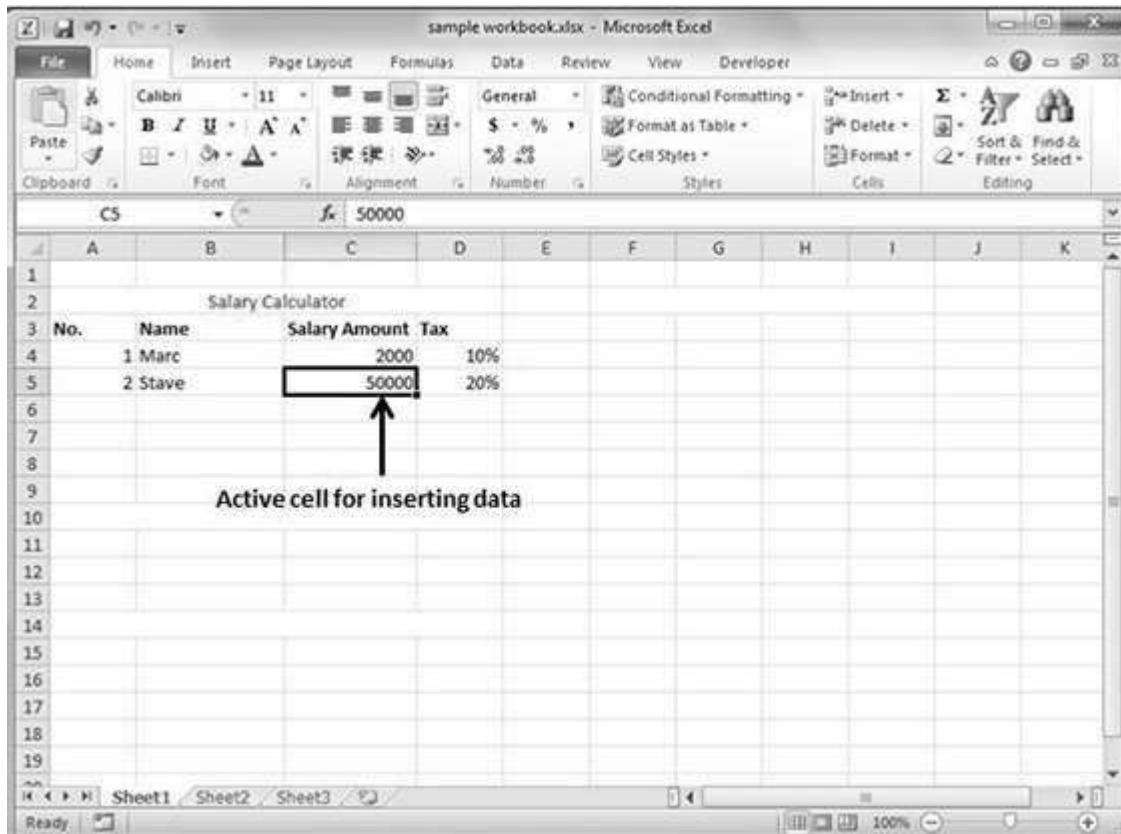

For getting more help with MS Excel from Microsoft you can press **F1** or by **File > Help -> Support -> Microsoft Office Help.**

In **MS Excel**, there are **1048576*16384** cells. MS Excel cell can have **Text, Numeric value or formulas**. An MS Excel cell can have maximum of 32000 characters.

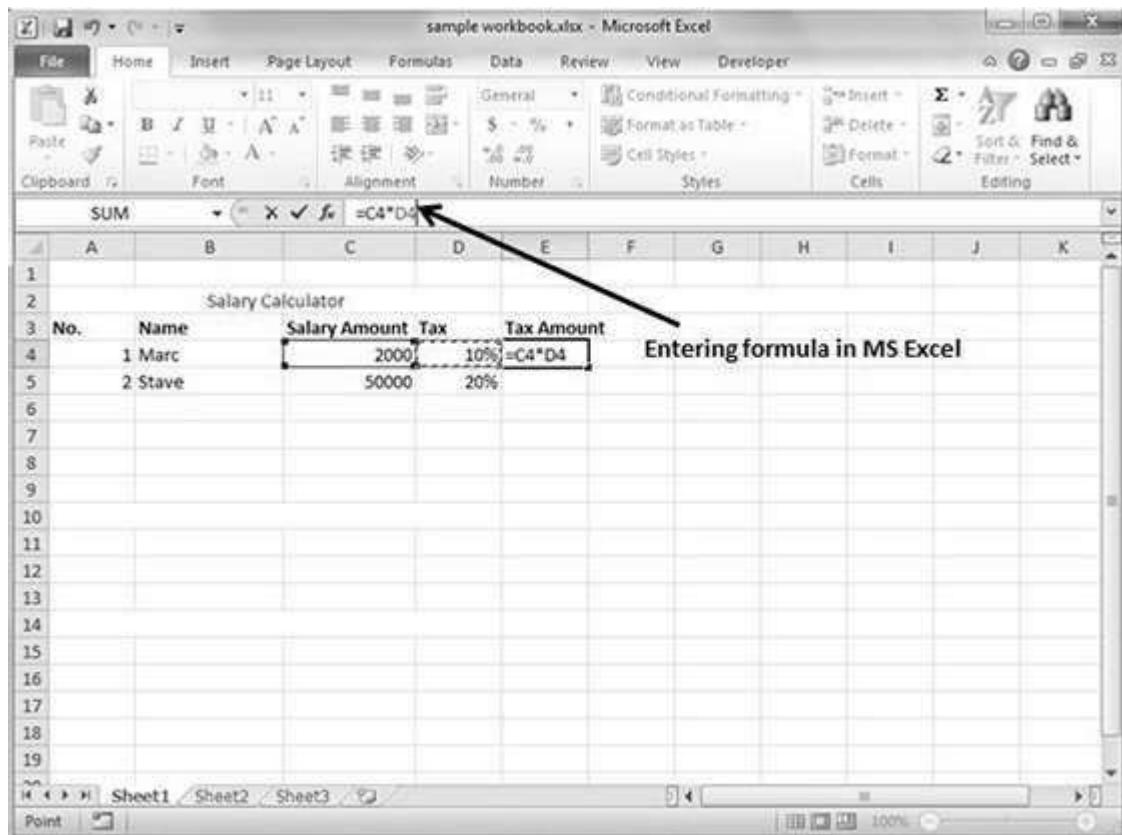

Inserting Data

For **inserting data** in **MS Excel**, just activate the cell type text or number and press enter or Navigation keys.

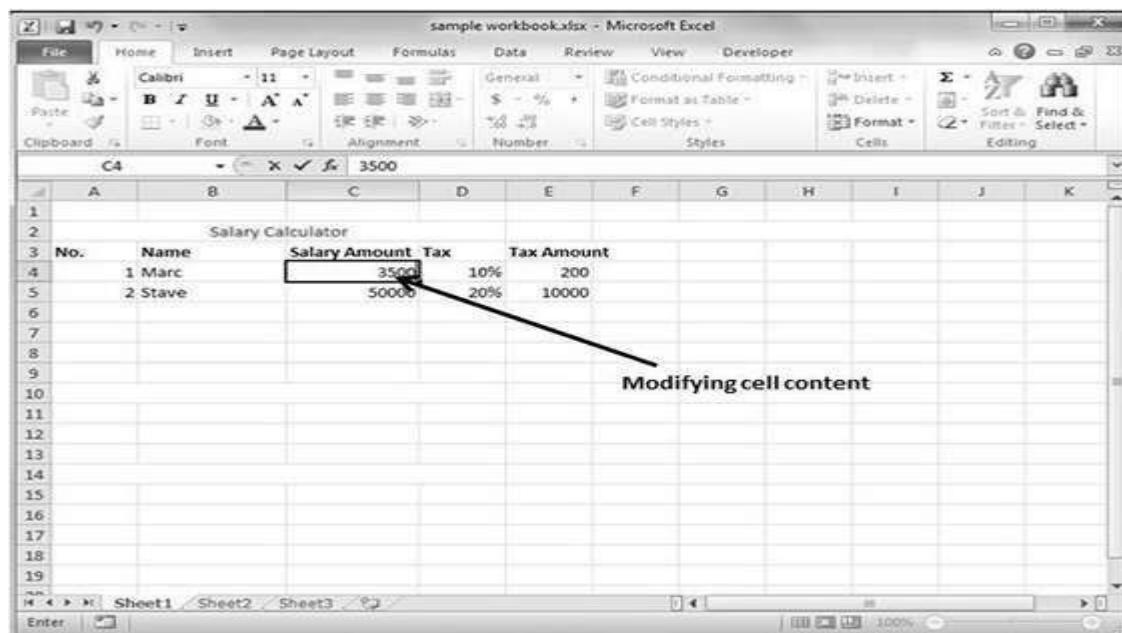

Inserting Formula

For inserting formula in MS Excel go to the formula bar, enter the formula and then press enter or navigation key. See the screen-shot below to understand it.

Modifying Cell Content

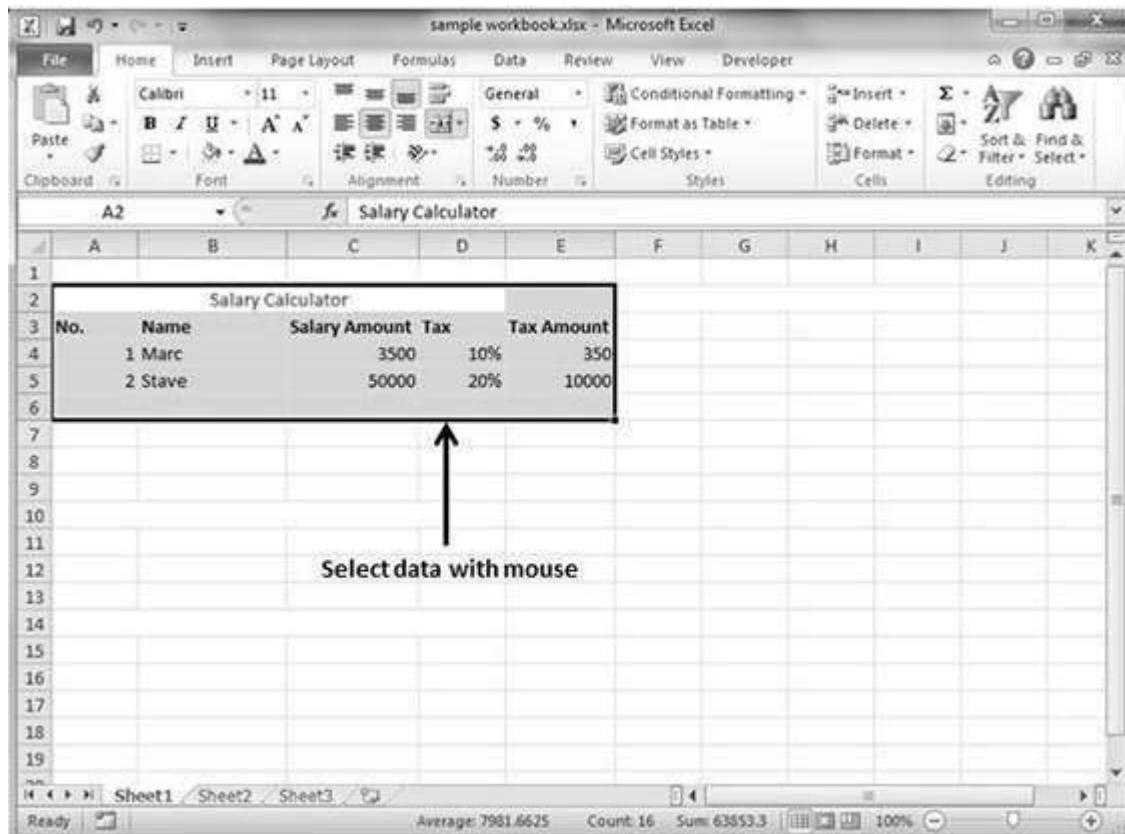

For modifying the cell content just activate the cell, enter a new value and then press enter or navigation key to see the changes. See the screen-shot below to understand it.

MS Excel provides various ways of selecting data in the sheet. Let us see those ways.

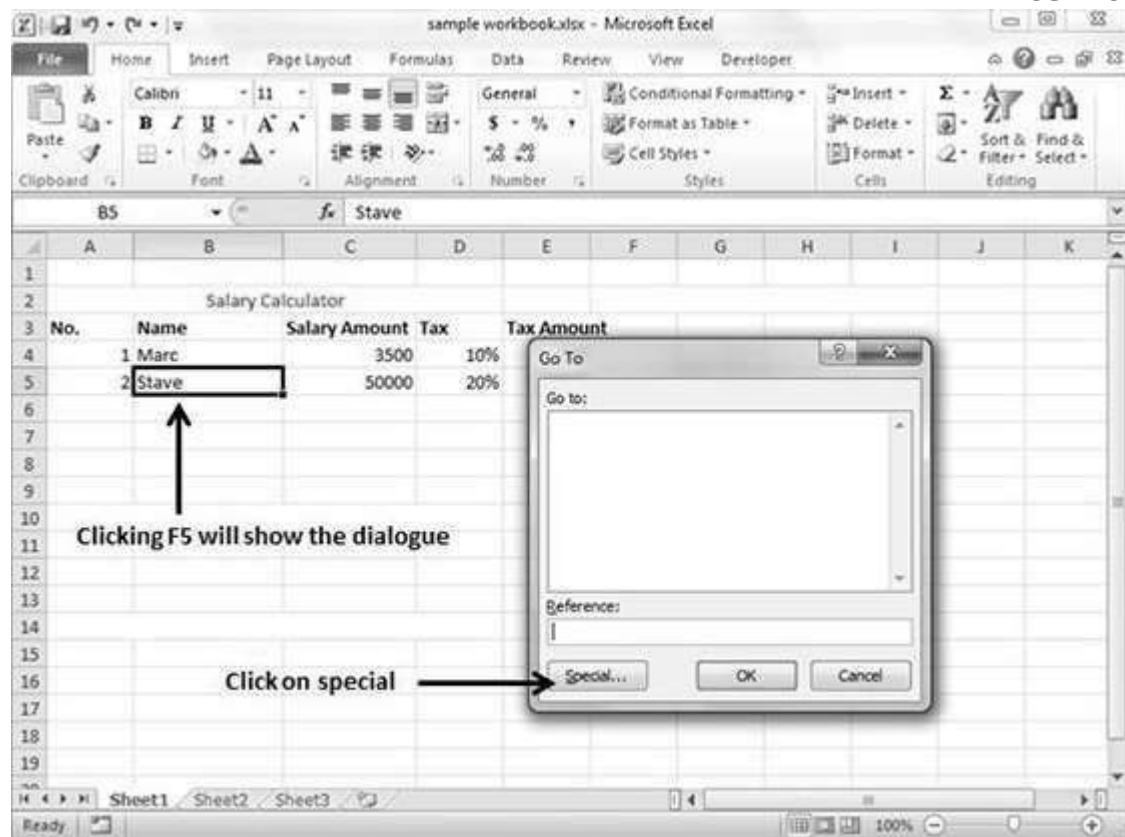

Select with Mouse

Drag the mouse over the data you want to select. It will select those cells as shown below.

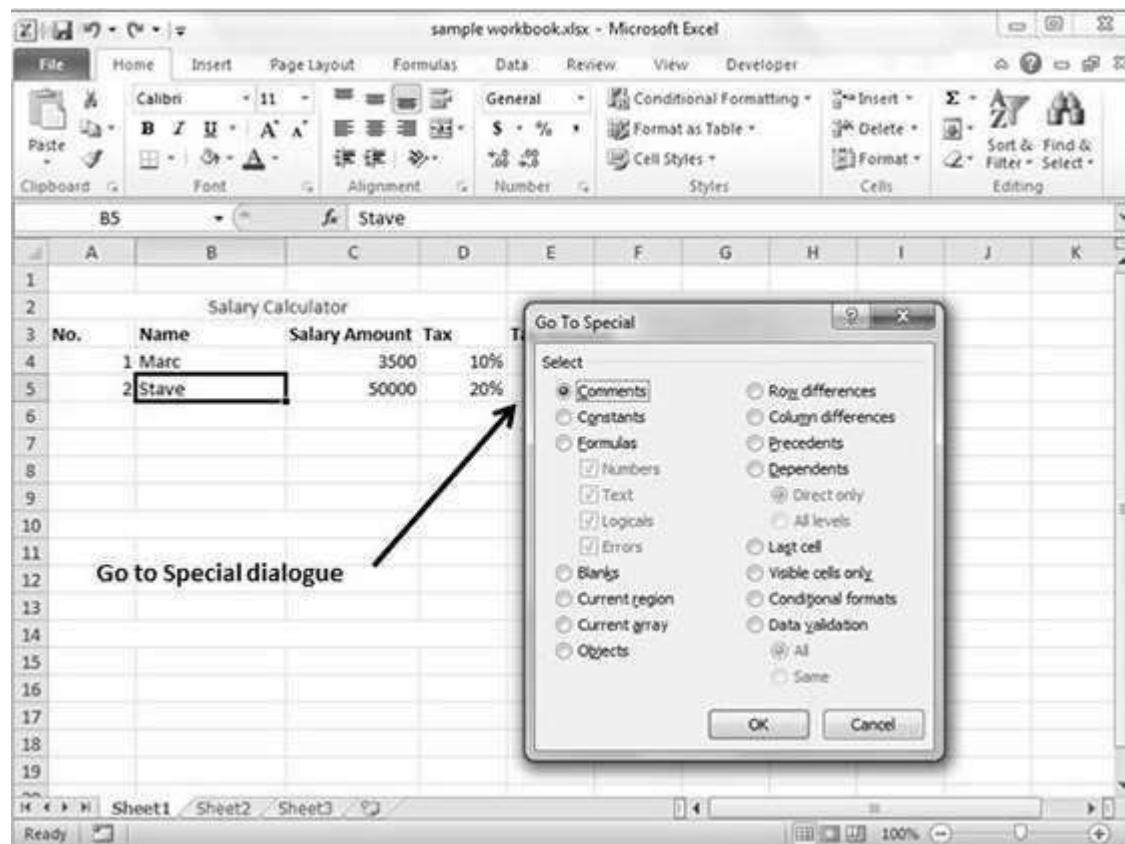

Select with Special

If you want to select specific region, select any cell in that region. Pressing **F5** will show the below dialogue box.

Click on **Special** button to see the below dialogue box. Select **current region** from the radio buttons. Click on **ok** to see the current region selected.

As you can see in the below screen, the data is selected for the current region.

The screenshot shows a Microsoft Excel 2010 window titled "sample workbook.xlsx - Microsoft Excel". The ribbon is visible at the top with tabs like File, Home, Insert, etc. The "Home" tab is selected. The formula bar shows "A2" and "Salary Calculator". The main area displays a table with the following data:

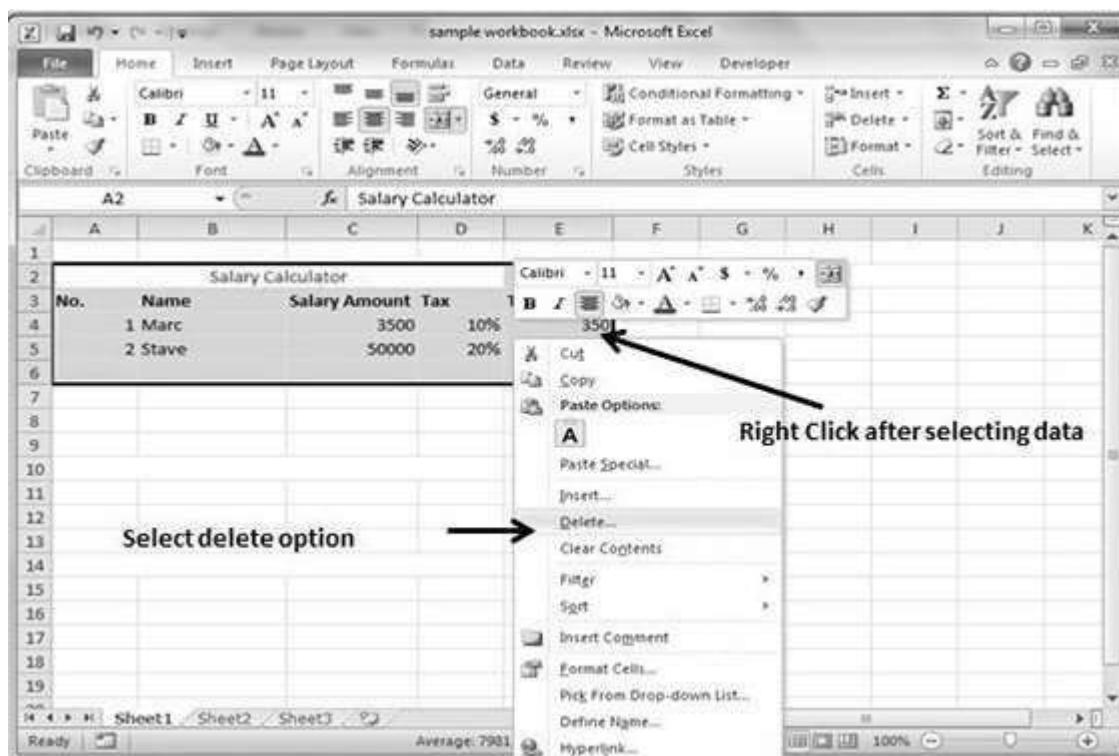

Salary Calculator				
No.	Name	Salary Amount	Tax	Tax Amount
1	Marc	3500	10%	350
2	Stave	50000	20%	10000

A black arrow points upwards from the text "Selected Data" to the top-left corner of the selected table area. The status bar at the bottom shows "Ready", "Sheet1", "Average: 7981.6625", "Count: 16", "Sum: 63853.3", and "100%".

MS Excel provides various ways of deleting data in the sheet. Let us see those ways.

Delete with Mouse

Select the data you want to delete. **Right Click** on the sheet. Select the **delete option**, to delete the data.

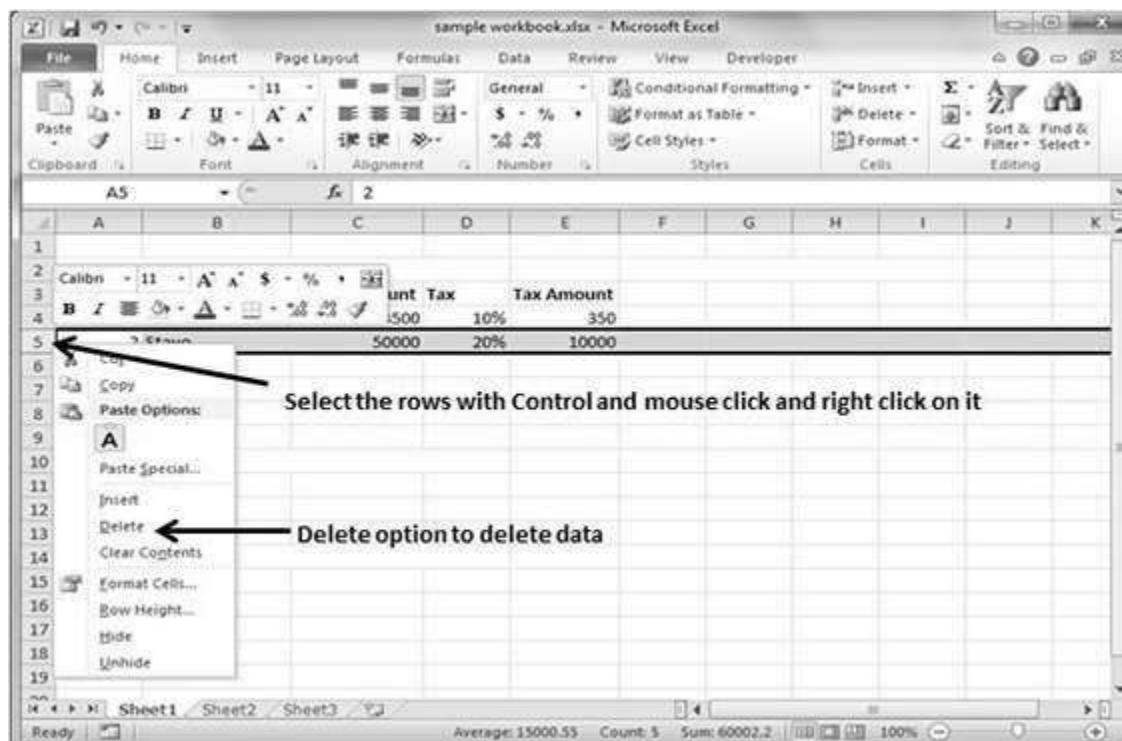

Delete with Delete Key

Select the data you want to delete. Press on the **Delete Button** from the keyboard to delete the data.

Selective Delete for Rows

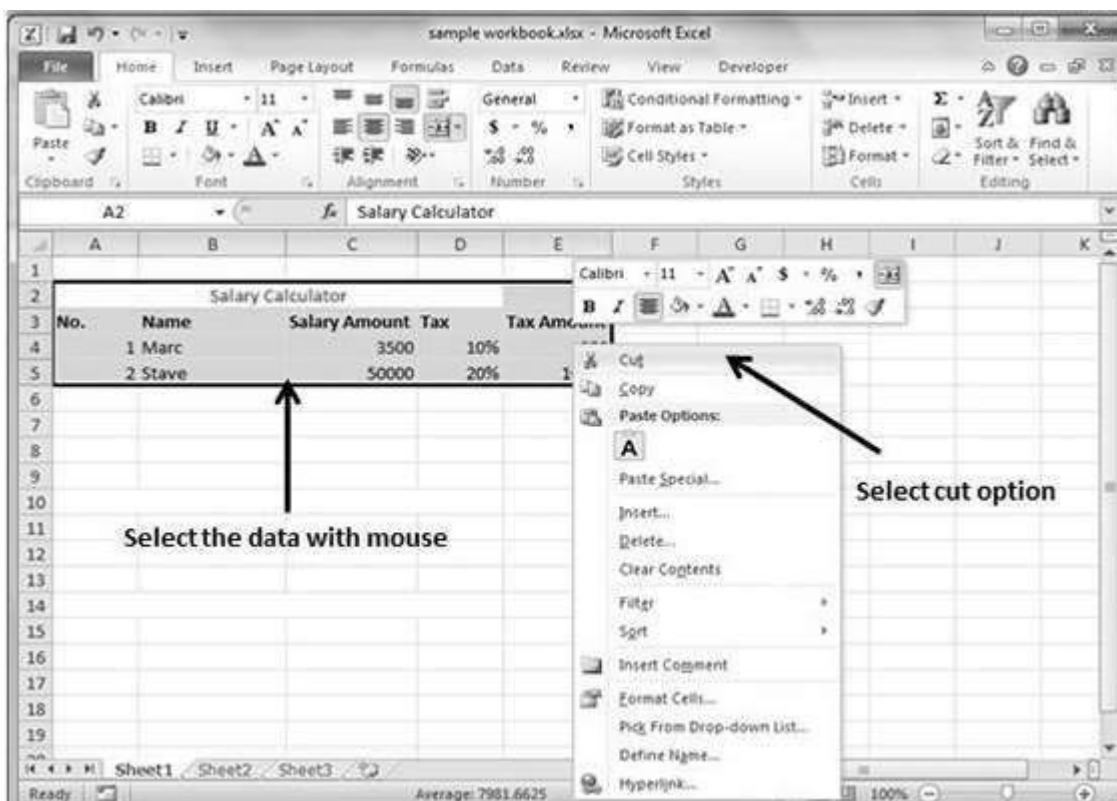

Select the rows, which you want to delete with **Mouse click + Control Key**. Then right click to show the various options. Select the **Delete option** to delete the selected rows.

17. MOVE DATA

Let us see how we can **Move Data** with **MS Excel**.

Step 1: Select the data you want to Move. **Right Click** and select the **cut option**.

Step 2: Select the first cell where you want to move the data. Right click on it and **paste the data**. You can see the data is moved now.

A screenshot of Microsoft Excel 2010 showing a table titled "Salary Calculator". The table has columns for No., Name, Salary Am Tax, and Tax Amount. Two rows of data are present: one for Marc with a salary of 3500 and a tax amount of 350, and another for Stave with a salary of 50000 and a tax amount of 10000. The table is highlighted with a black border. A black arrow points upwards from the bottom of the table towards the text "Moved Data". The Excel ribbon is visible at the top, and the status bar at the bottom shows "Average: 7981.6625", "Count: 16", "Sum: 63853.3", and "100%".

Salary Calculator				
No.	Name	Salary Am Tax	Tax Amount	
1	Marc	3500	10%	350
2	Stave	50000	20%	10000

Moved Data

Row and Column Basics

MS Excel is in tabular format consisting of rows and columns.

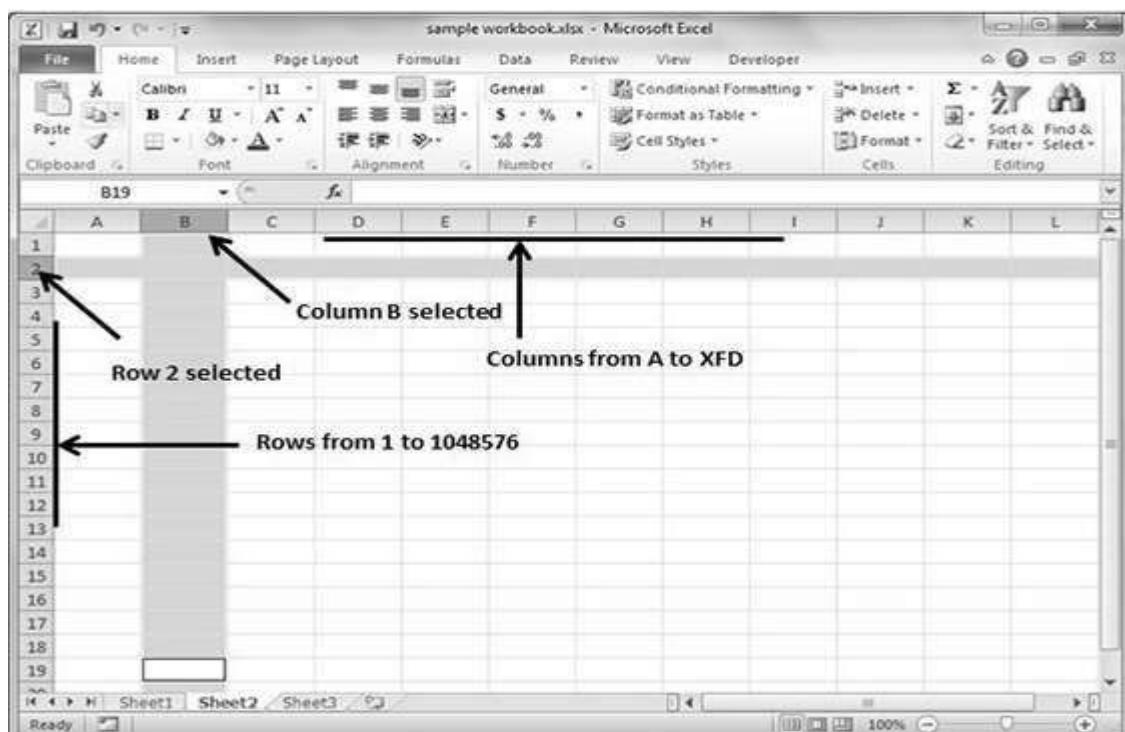

- Row runs horizontally while Column runs vertically.
- Each row is identified by row number, which runs vertically at the left side of the sheet.
- Each column is identified by column header, which runs horizontally at the top of the sheet.

For **MS Excel** 2010, Row numbers ranges from **1** to **104857**; in total **1048576** rows, and Columns ranges from **A** to **XFD**; in total **16384** columns.

Navigation with Rows and Columns

Let us see how to move to the last row or the last column.

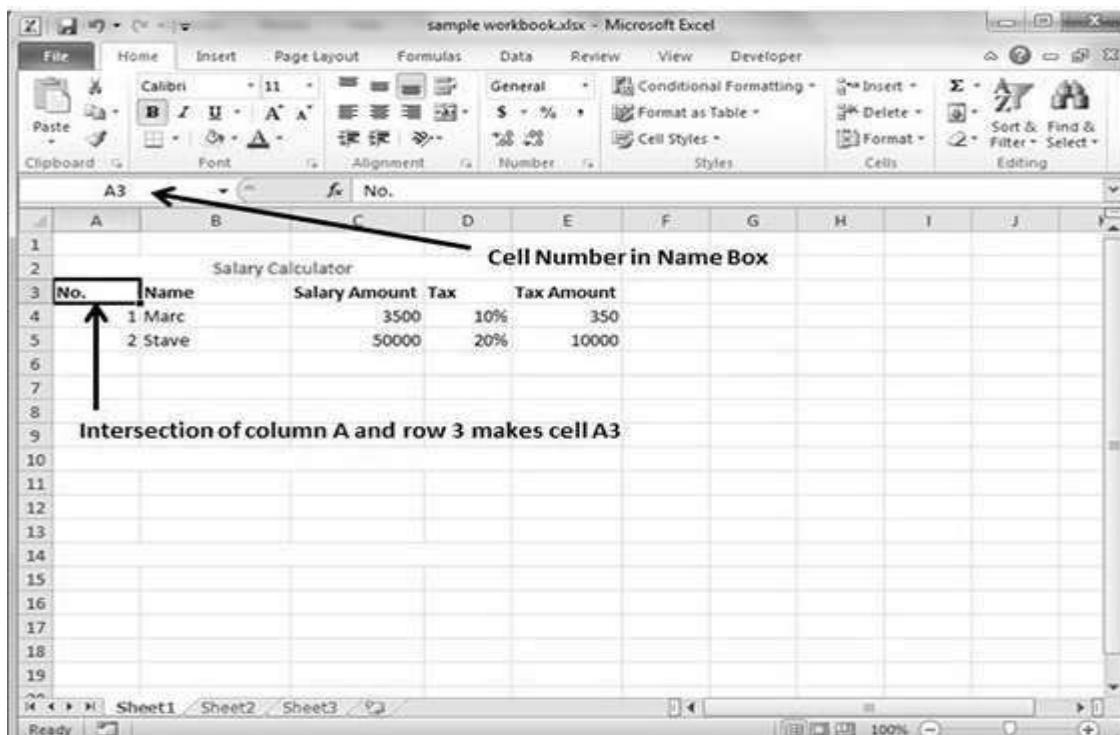

- You can go to the last row by clicking **Control + Down Navigation arrow**.
- You can go to the last column by clicking **Control + Right Navigation arrow**.

Cell Introduction

The intersection of rows and columns is called **cell**.

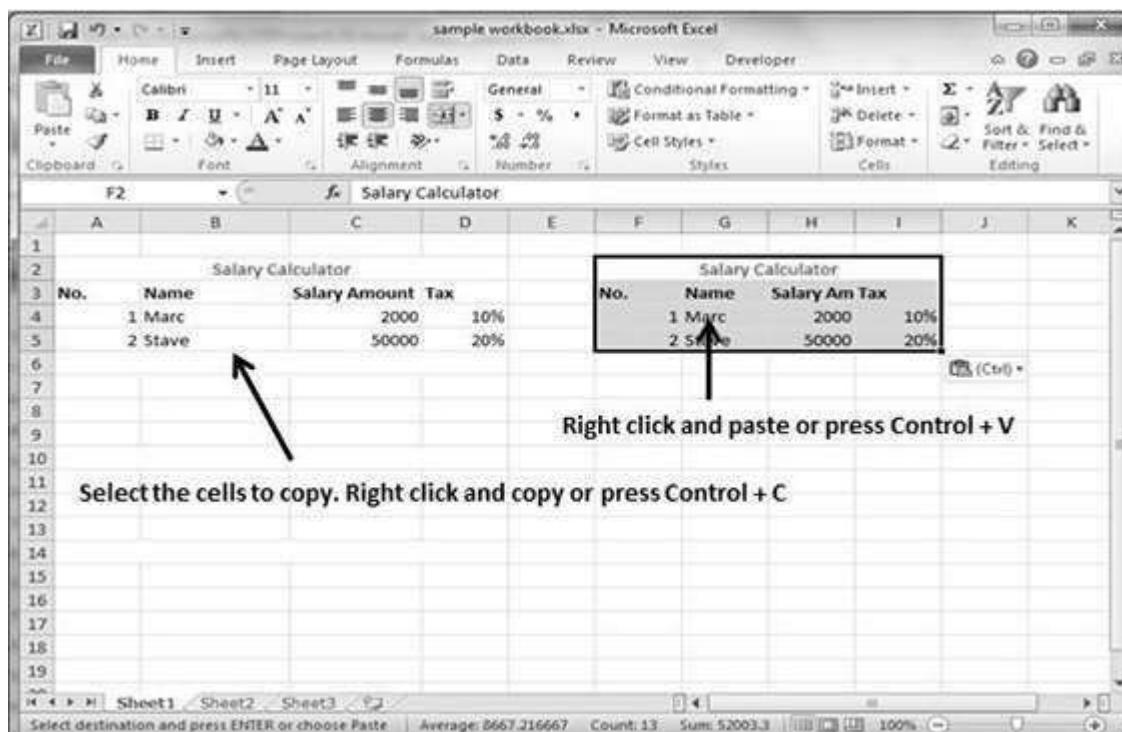

Cell is identified with **Combination of column header and row number**. For example: A1, A2

MS Excel provides **copy paste** option in different ways. The simplest method of copy paste is as below.

Copy Paste

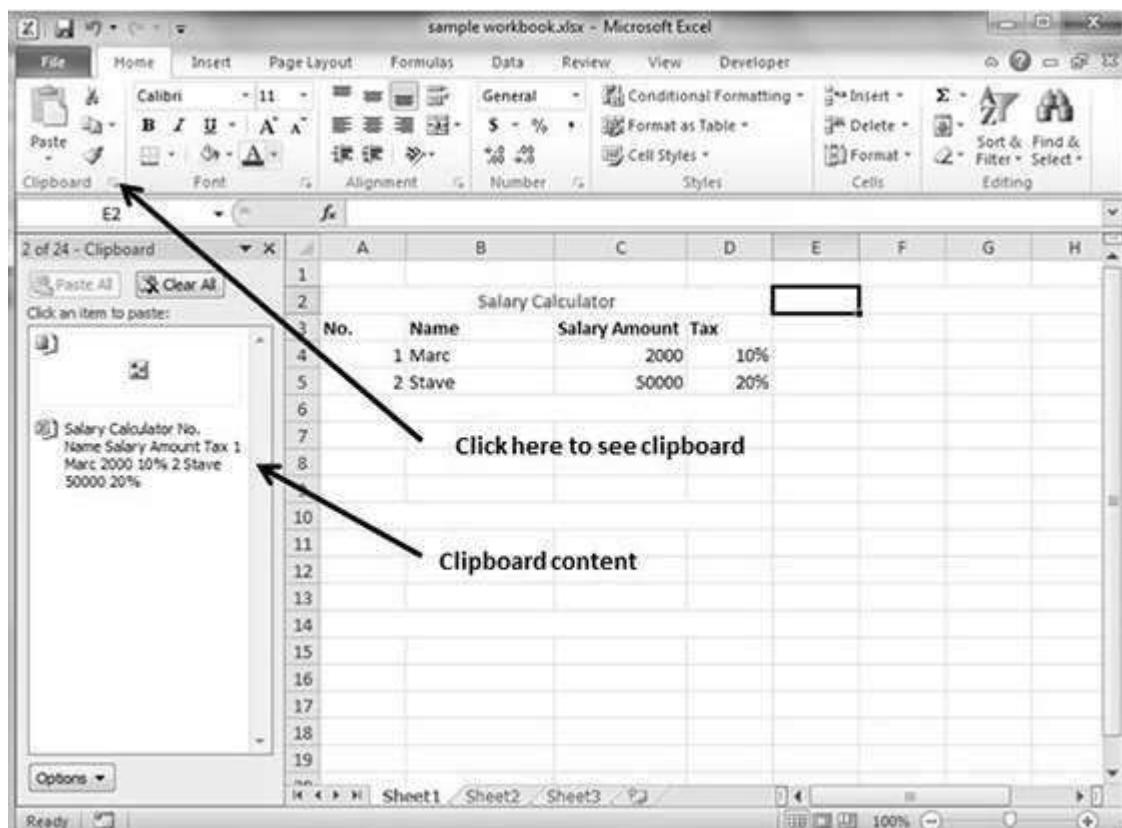

- To copy and paste, just select the cells you want to copy. Choose **copy option** after right click or press **Control + C**.
- Select the cell where you need to paste this copied content. Right click and select **paste option** or press **Control + V**.

In this case, **MS Excel** will copy everything such as values, formulas, Formats, Comments and validation. MS Excel will overwrite the content with paste. If you want to undo this, press **Control + Z** from the keyboard.

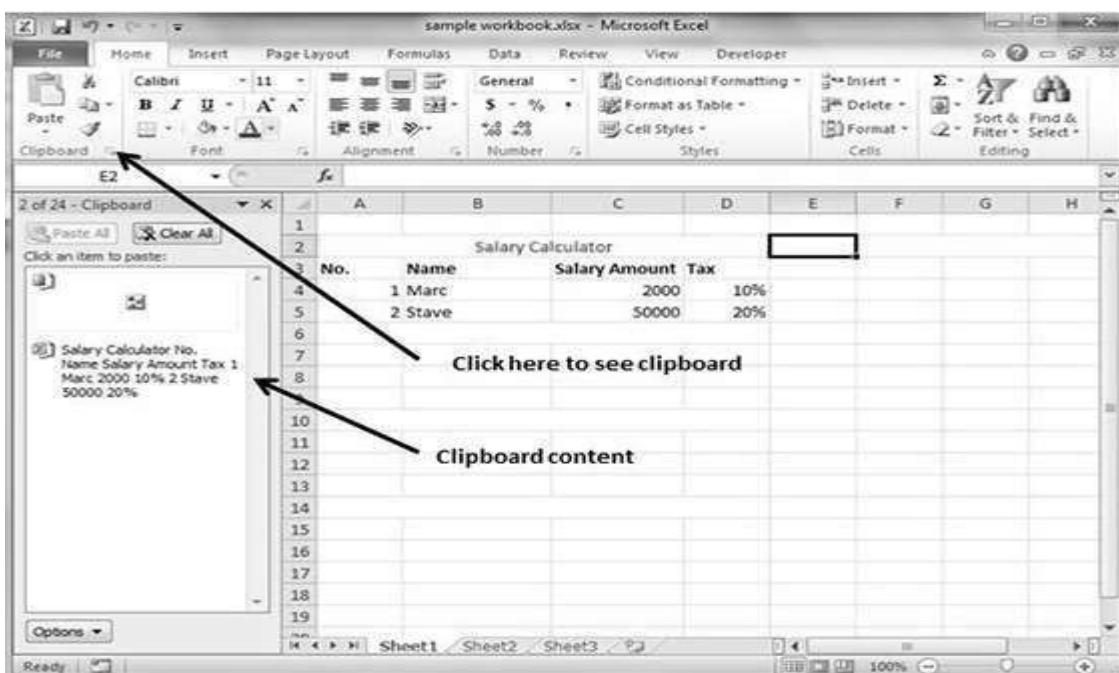

Copy Paste using Office Clipboard

When you copy data in MS Excel, it puts the copied content in Windows and Office Clipboard. You can view the clipboard content by **Home -> Clipboard**. View the clipboard content. Select the cell where you need to paste. Click on paste, to paste the content.

Copy Paste in Special way

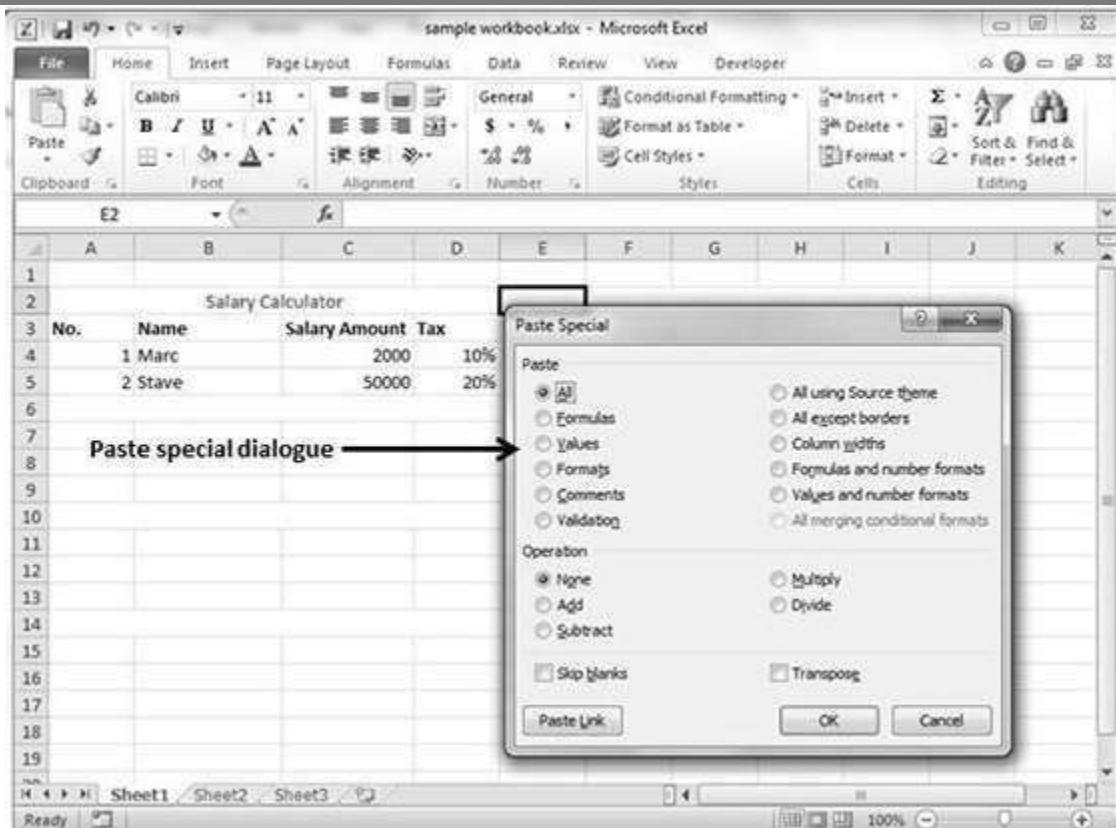

You may not want to copy everything in some cases. For example, you want to copy only Values or you want to copy only the formatting of cells. Select the paste special option as shown below.

Below are the various options available in paste special.

- **All:** Pastes the cell's contents, formats, and data validation from the Windows Clipboard.
- **Formulas:** Pastes formulas, but not formatting.
- **Values:** Pastes only values not the formulas.
- **Formats:** Pastes only the formatting of the source range.
- **Comments:** Pastes the comments with the respective cells.
- **Validation:** Pastes validation applied in the cells.
- **All using source theme:** Pastes formulas, and all formatting.
- **All except borders:** Pastes everything except borders that appear in the source range.
- **Column Width:** Pastes formulas, and also duplicates the column width of the copied cells.
- **Formulas & Number Formats:** Pastes formulas and number formatting only.
- **Values & Number Formats:** Pastes the results of formulas, plus the number.
- **Merge Conditional Formatting:** This icon is displayed only when the copied cells contain conditional formatting. When clicked, it merges the copied conditional formatting with any conditional formatting in the destination range.
- **Transpose:** Changes the orientation of the copied range. Rows become columns, and columns become rows. Any formulas in the copied range are adjusted so that they work properly when transposed.

20. FIND AND REPLACE

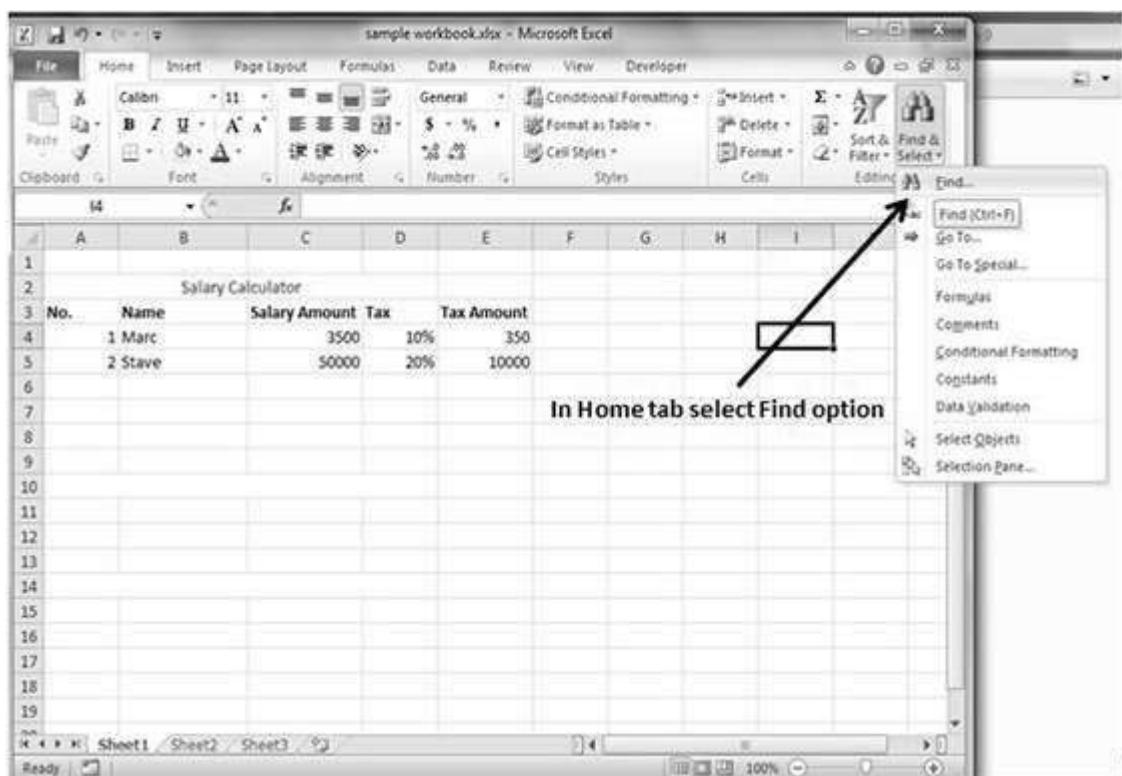

MS Excel provides **Find & Replace** option for finding text within the sheet.

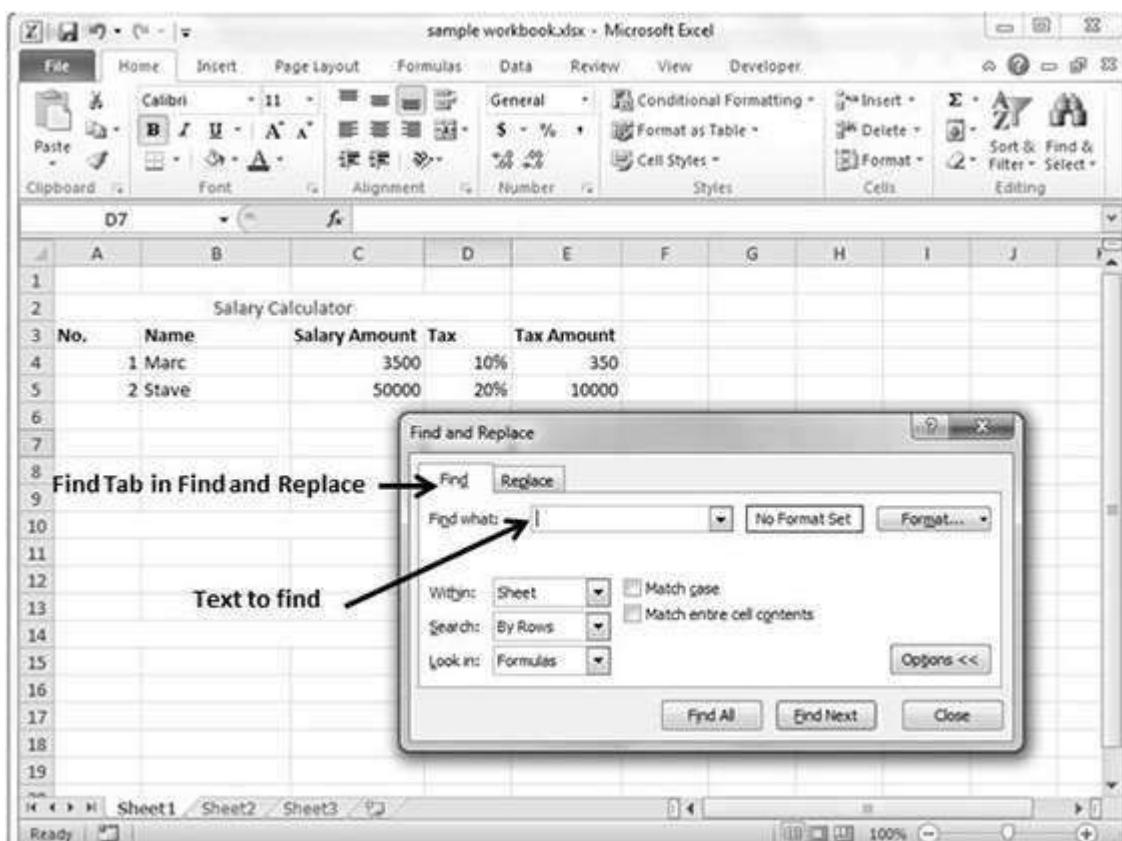

Find and Replace Dialogue

Let us see how to access the Find & Replace Dialogue.

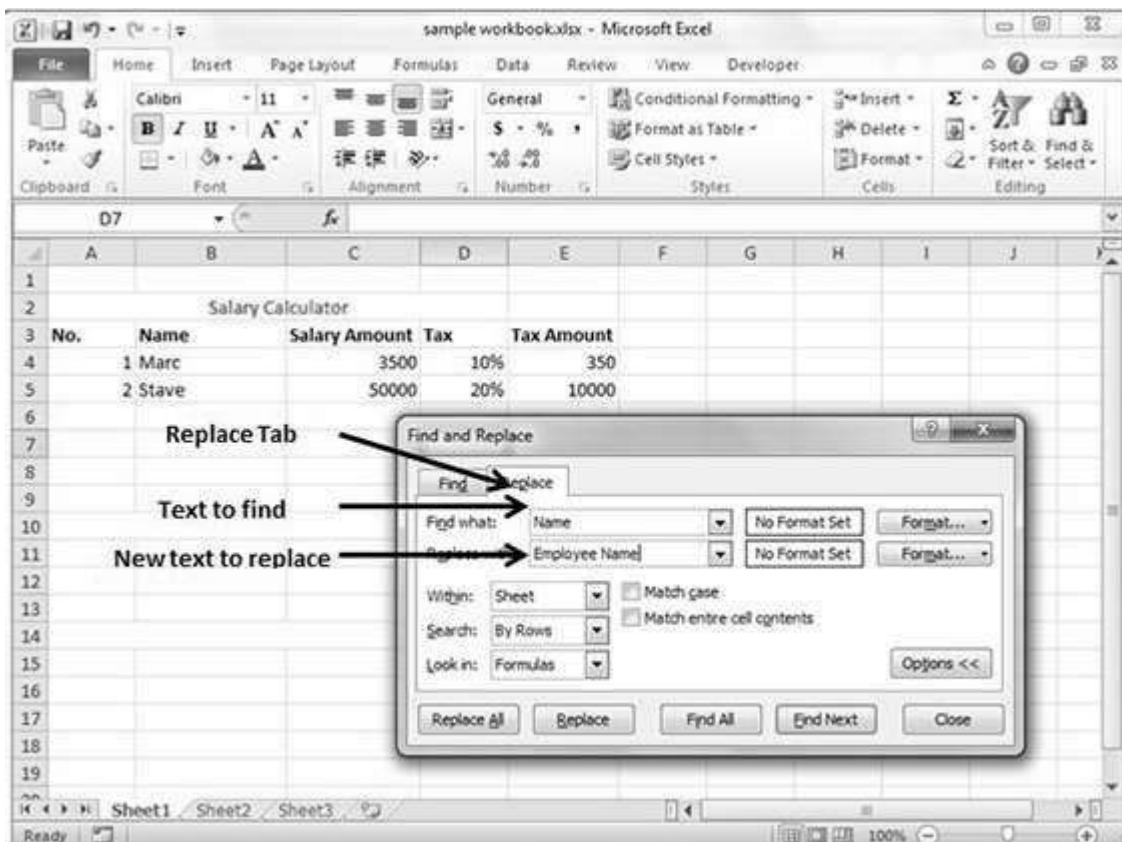

To access the Find & Replace, Choose **Home -> Find & Select -> Find**, or press **Control + F Key**. See the image below.

You can see the **Find and Replace dialogue** as below.

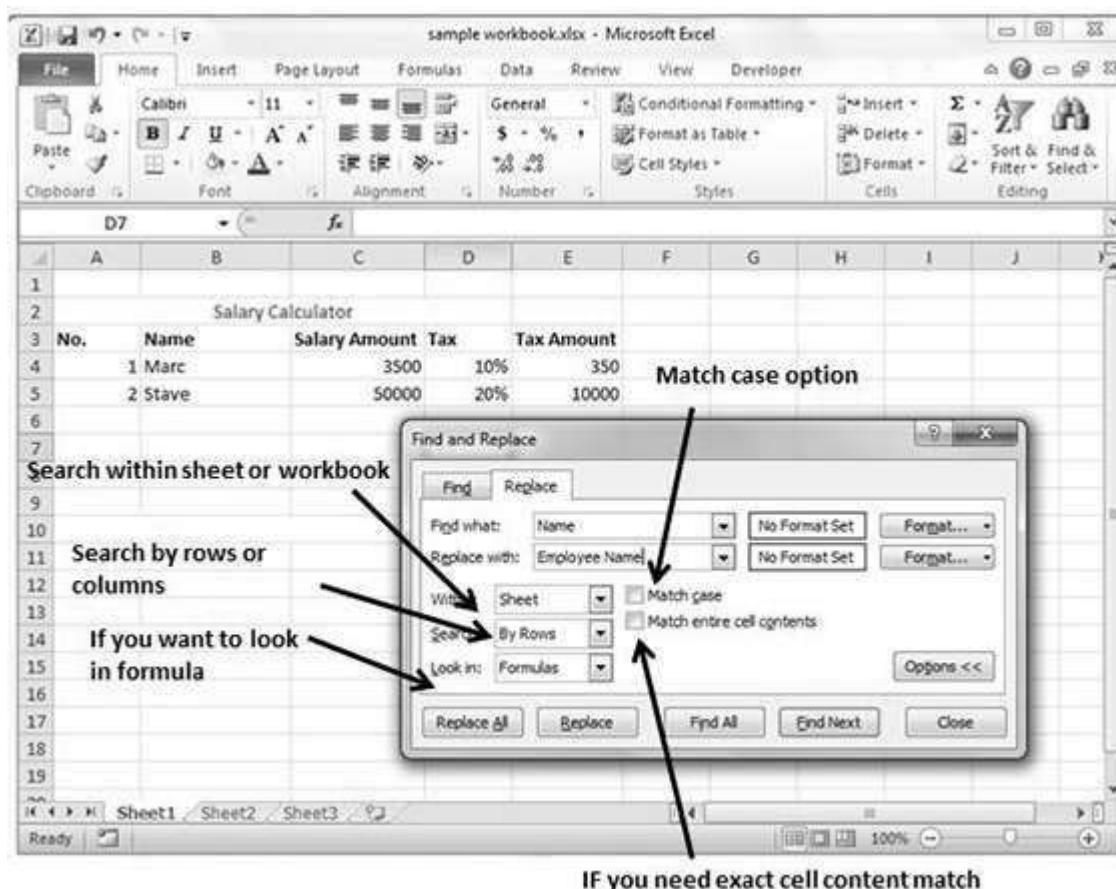

You can replace the found text with the new text in the **Replace tab**.

Exploring Options

Now, let us see the various options available under the Find dialogue.

- **Within:** Specifying the search should be in Sheet or workbook.
- **Search By:** Specifying the internal search method by rows or by columns.
- **Look In:** If you want to find text in formula as well, then select this option.
- **Match Case:** If you want to match the case like lower case or upper case of words, then check this option.
- **Match Entire Cell Content:** If you want the exact match of the word with cell, then check this option.

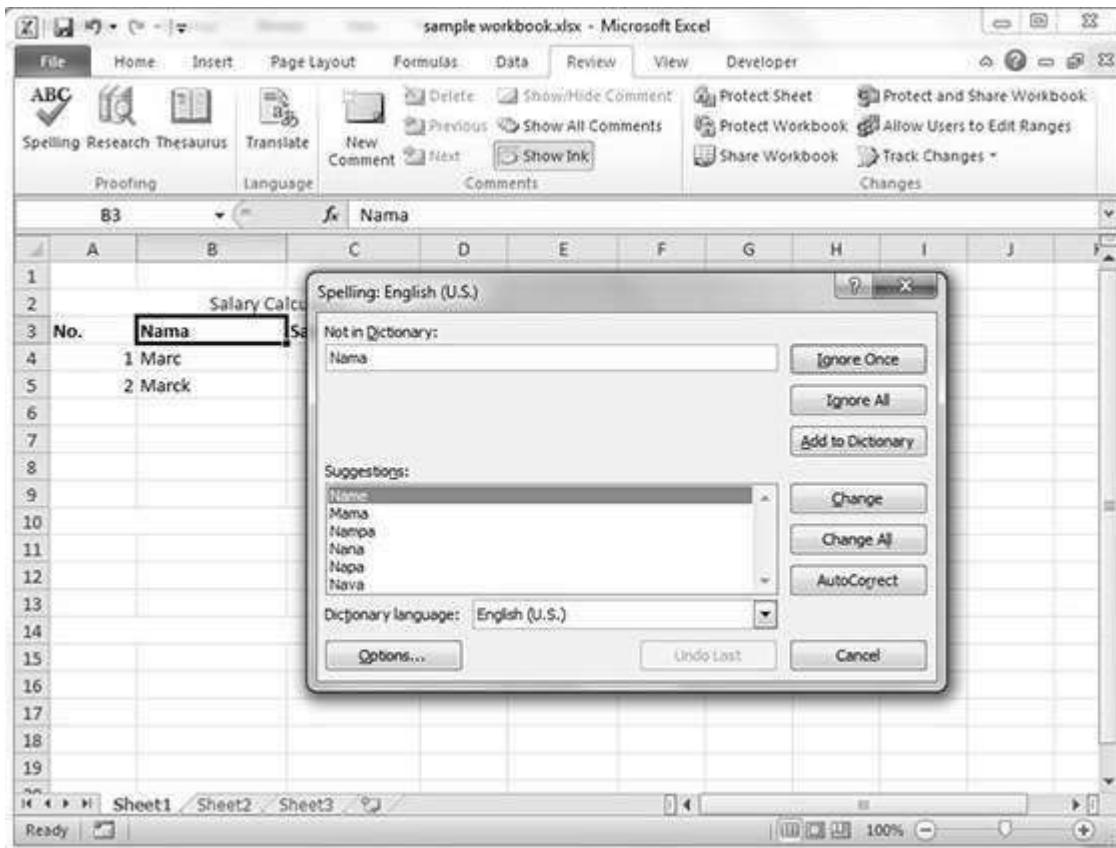

MS Excel provides a feature of Word Processing program called **Spelling check**. We can get rid of the spelling mistakes with the help of spelling check feature.

Spell Check Basis

Let us see how to access the spell check.

- To access the spell checker, Choose **Review** \Rightarrow **Spelling** or press **F7**.
- To check the spelling in just a particular range, **select the range** before you activate the spell checker.
- If the spell checker finds any words it does not recognize as correct, it displays the **Spelling dialogue** with suggested options.

Exploring Options

Let us see the various options available in **spell check** dialogue.

- **Ignore Once:** Ignores the word and continues the spell check.
- **Ignore All:** Ignores the word and all subsequent occurrences of it.
- **Add to Dictionary:** Adds the word to the dictionary.
- **Change:** Changes the word to the selected word in the Suggestions list.
- **Change All:** Changes the word to the selected word in the Suggestions list and changes all subsequent occurrences of it without asking.

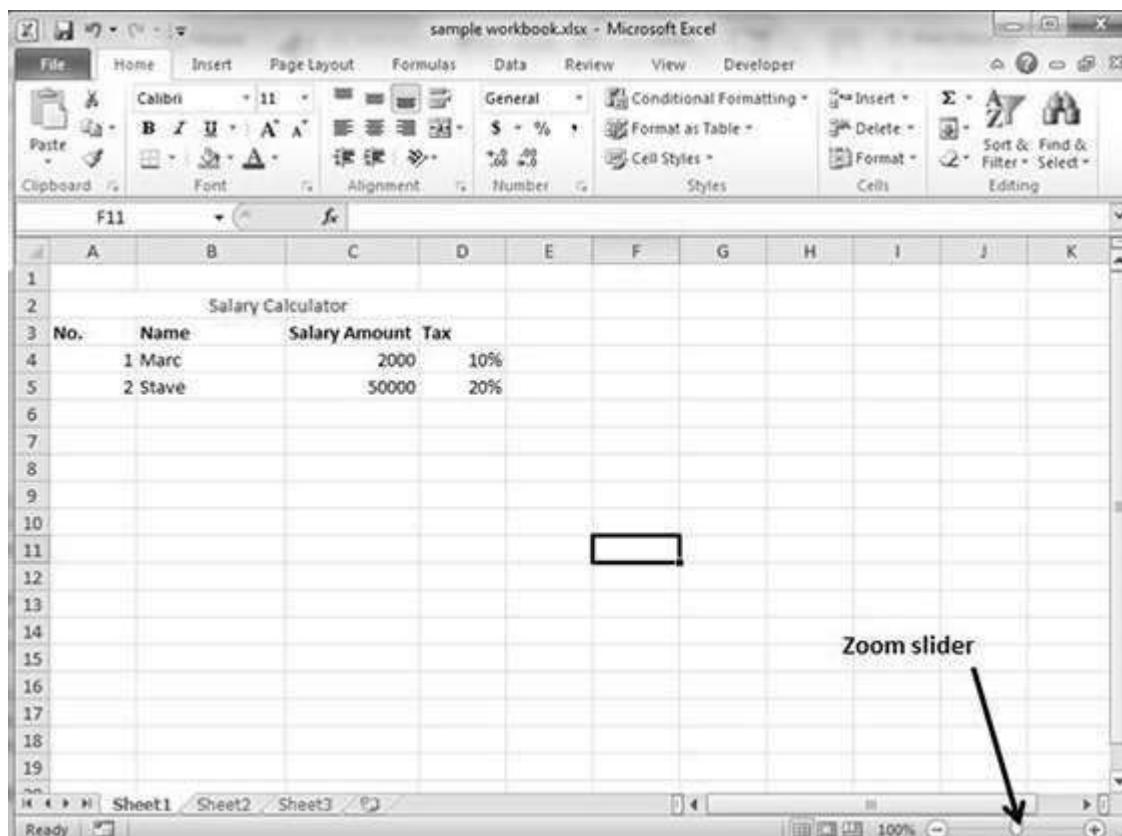

- **AutoCorrect:** Adds the misspelled word and its correct spelling (which you select from the list) to the AutoCorrect list.

22. ZOOM IN/OUT

Zoom Slider

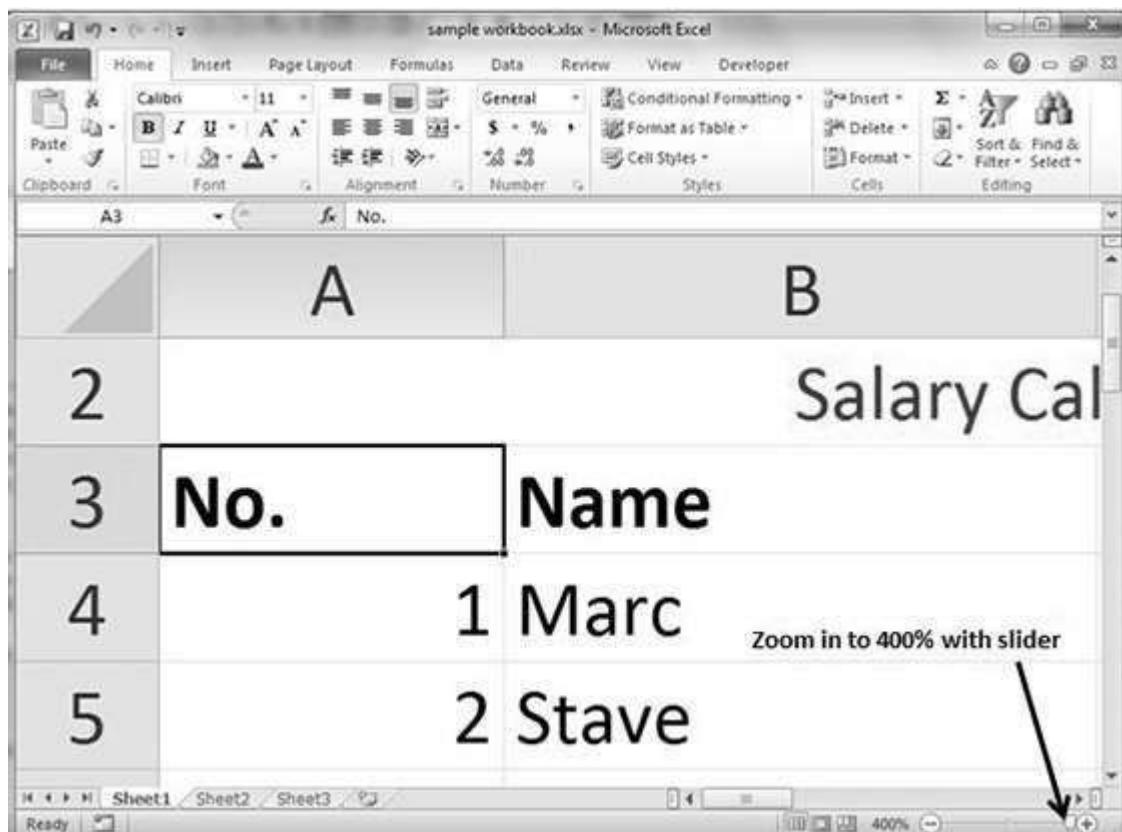

By default, everything on screen is displayed at 100% in MS Excel. You can change the zoom percentage from 10% (tiny) to 400% (huge). Zooming doesn't change the font size, so it has no effect on the printed output.

You can view the zoom slider at the right bottom of the workbook as shown below.

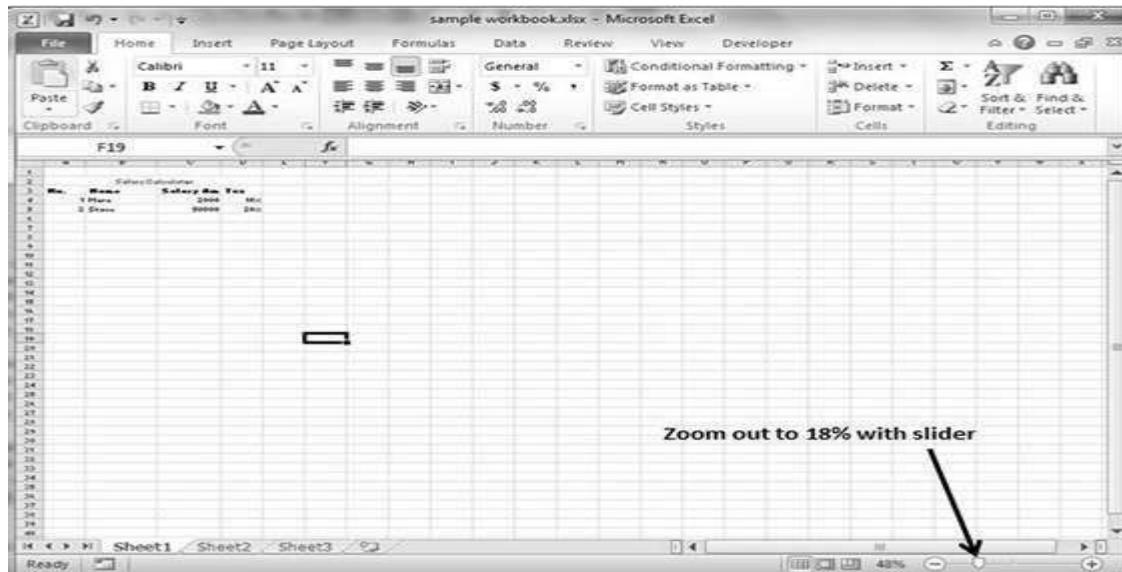

Zoom In

You can zoom in the workbook by moving the slider to the right. It will change the only view of the workbook. You can have maximum of 400% zoom in. See the below screen-shot.

Zoom Out

You can zoom out the workbook by moving the slider to the left. It will change the only view of the workbook. You can have maximum of 10% zoom in. See the below screen-shot.

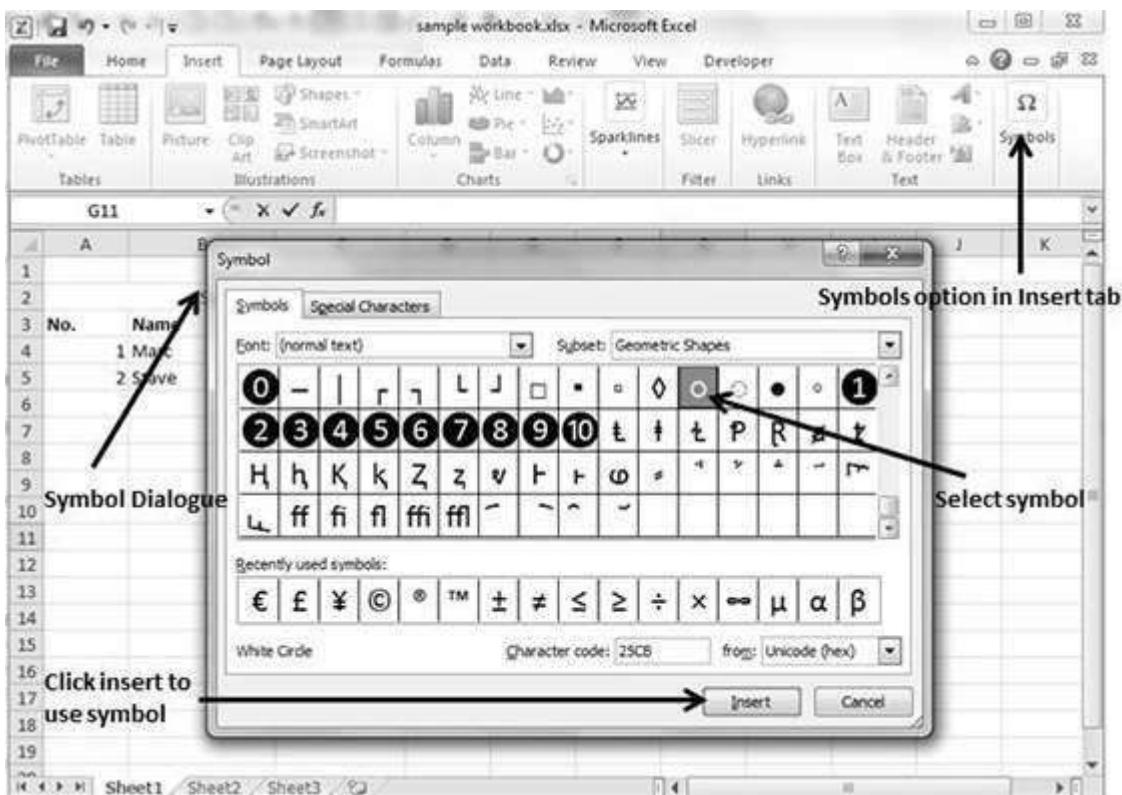

If you want to insert some symbols or special characters that are not found on the keyboard in that case you need to use the **Symbols option**.

Using Symbols

Go to **Insert** » **Symbols** » **Symbol** to view available symbols. You can see many symbols available there like Pi, alpha, beta, etc.

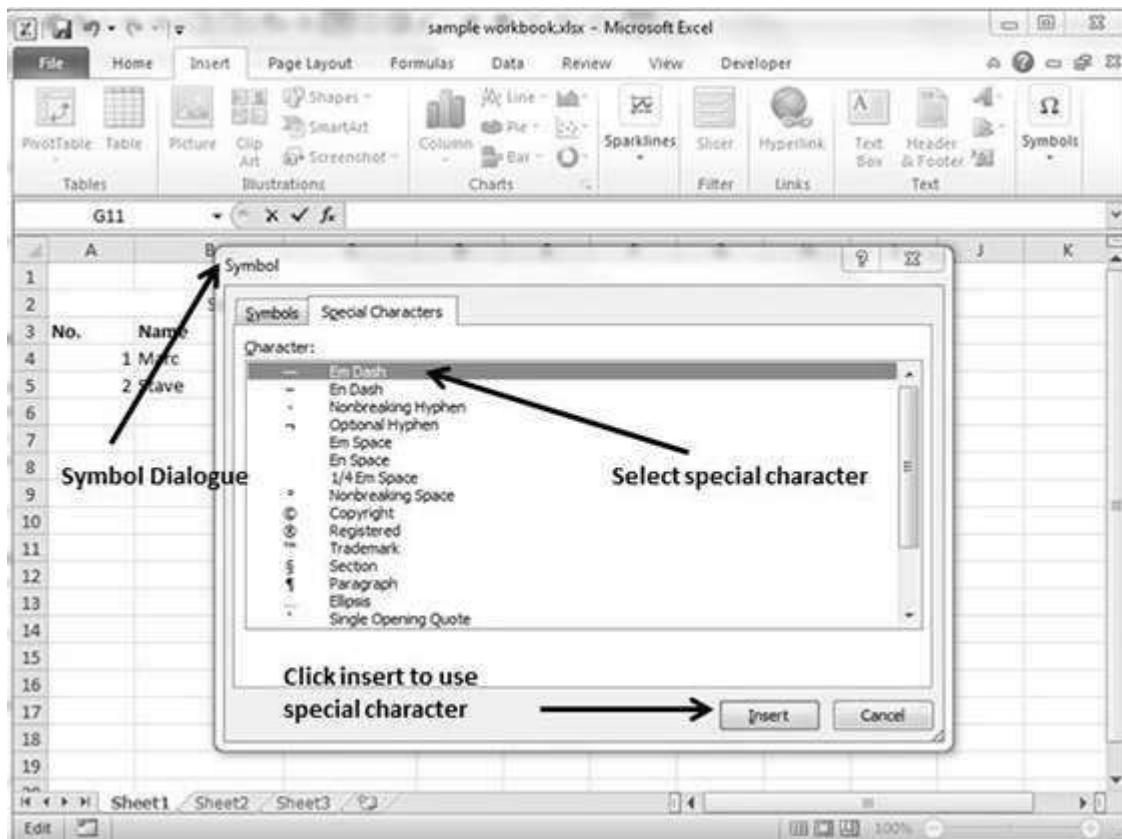

Select the symbol you want to add and click insert to use the symbol.

Using Special Characters

Go to **Insert** » **Symbols** » **Special Characters** to view the available special characters. You can see many special characters available there like Copyright, Registered etc.

Select the special character you want to add and click insert, to use the special character.

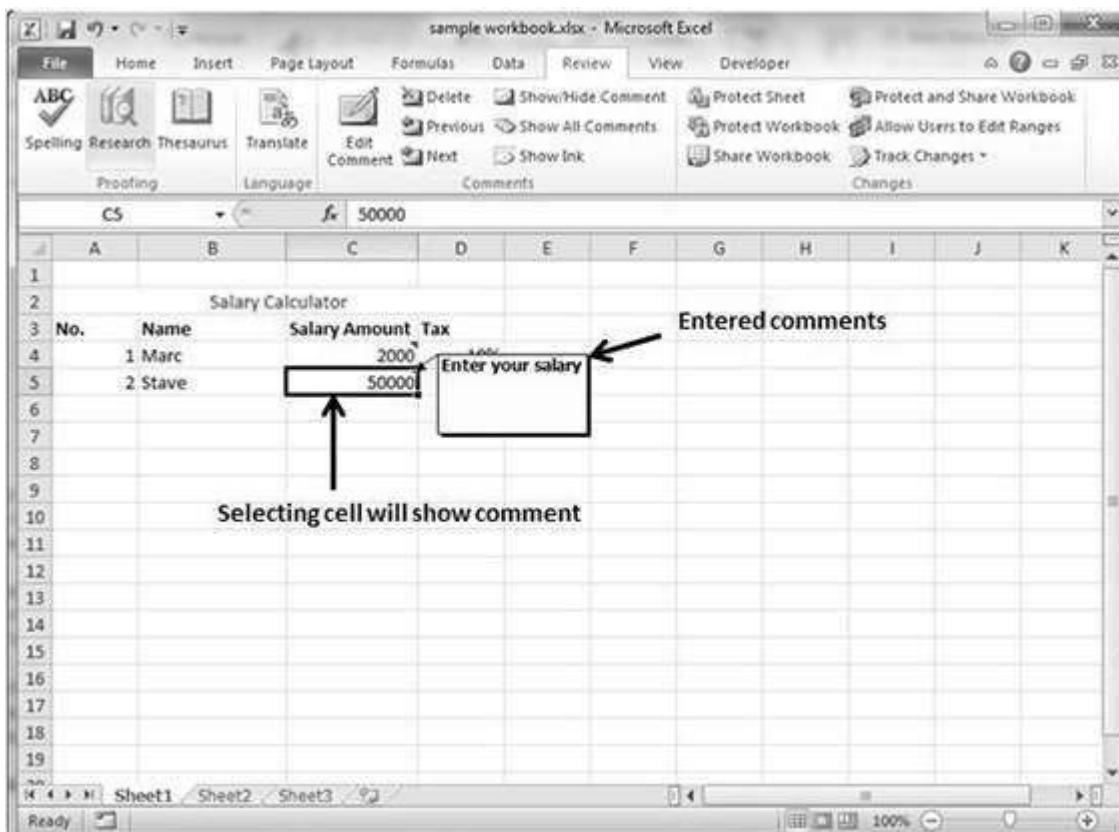

Adding Comment to Cell

Adding comment to cell helps in understanding the purpose of cell, what input it should have, etc. It helps in proper documentation.

To add comment to a cell, select the cell and perform any of the actions mentioned below.

- Choose Review » Comments » New Comment.
- Right-click the cell and choose Insert Comment from available options.
- Press Shift+F2.

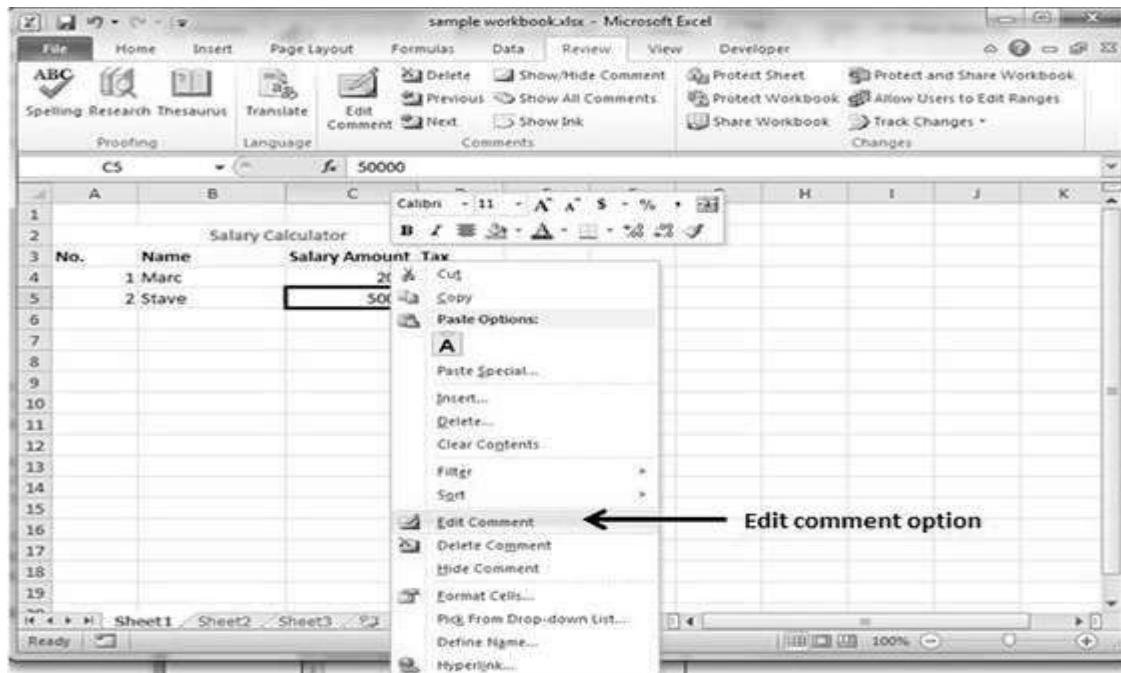

Initially, a comment consists of Computer's user name. You have to modify it with text for the cell comment.

Modifying Comment

You can modify the comment you have entered before as mentioned below.

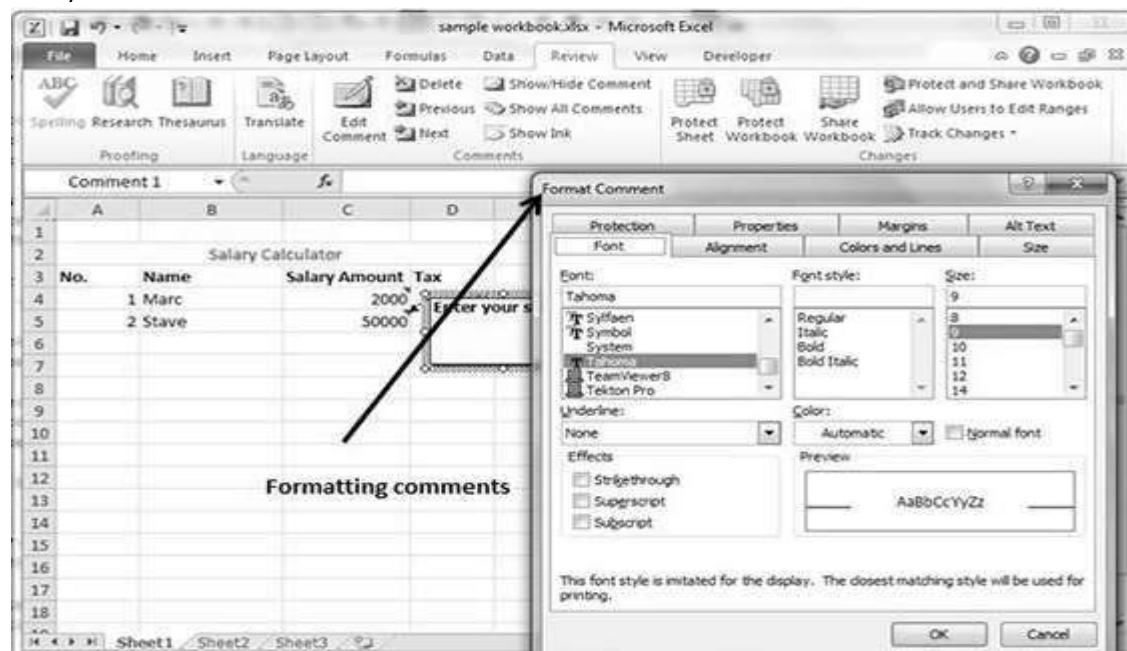

- Select the cell on which the comment appears.
- Right-click the cell and choose the Edit Comment from the available options.
- Modify the comment.

Formatting Comment

Various formatting options are available for comments. For formatting a comment, **Right click on cell » Edit comment » Select comment » Right click on it » Format comment**. With formatting of comment you can change the color, font,

size, etc. of the comment.

Text Boxes

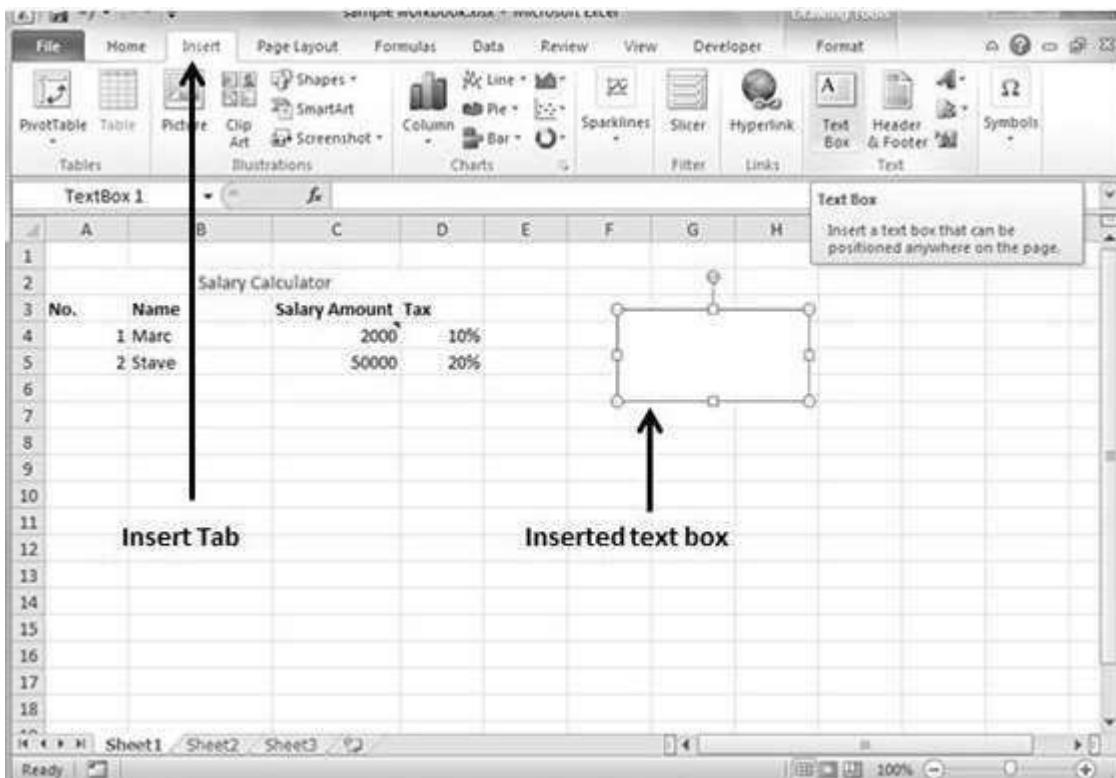

Text boxes are special graphic objects that combine the text with a rectangular graphic object. Text boxes and cell comments are similar in displaying the text in rectangular box. But text boxes are always visible, while cell comments become visible after selecting the cell.

Adding Text Boxes

To add a text box, perform the below actions.

- Choose Insert » Text Box » choose text box or draw it.

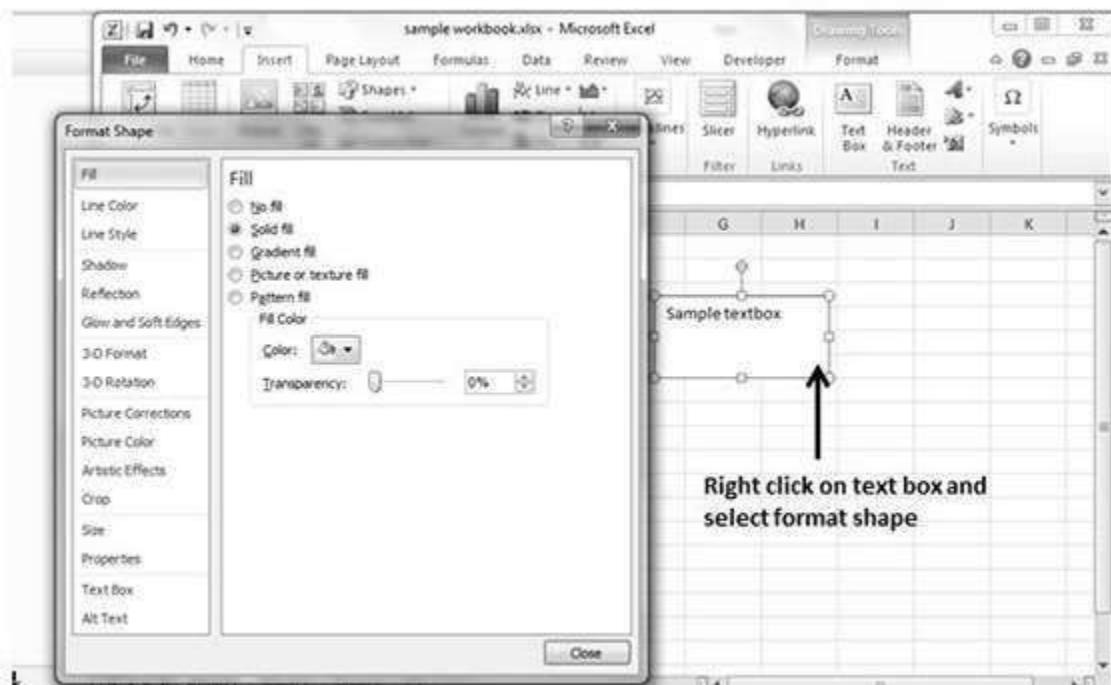

Initially, the comment consists of Computer's user name. You have to modify it with text for the cell comment.

Formatting Text Box

After you have added the text box, you can format it by changing the font, font size, font style, and alignment, etc. Let us see some of the important options of formatting a text box.

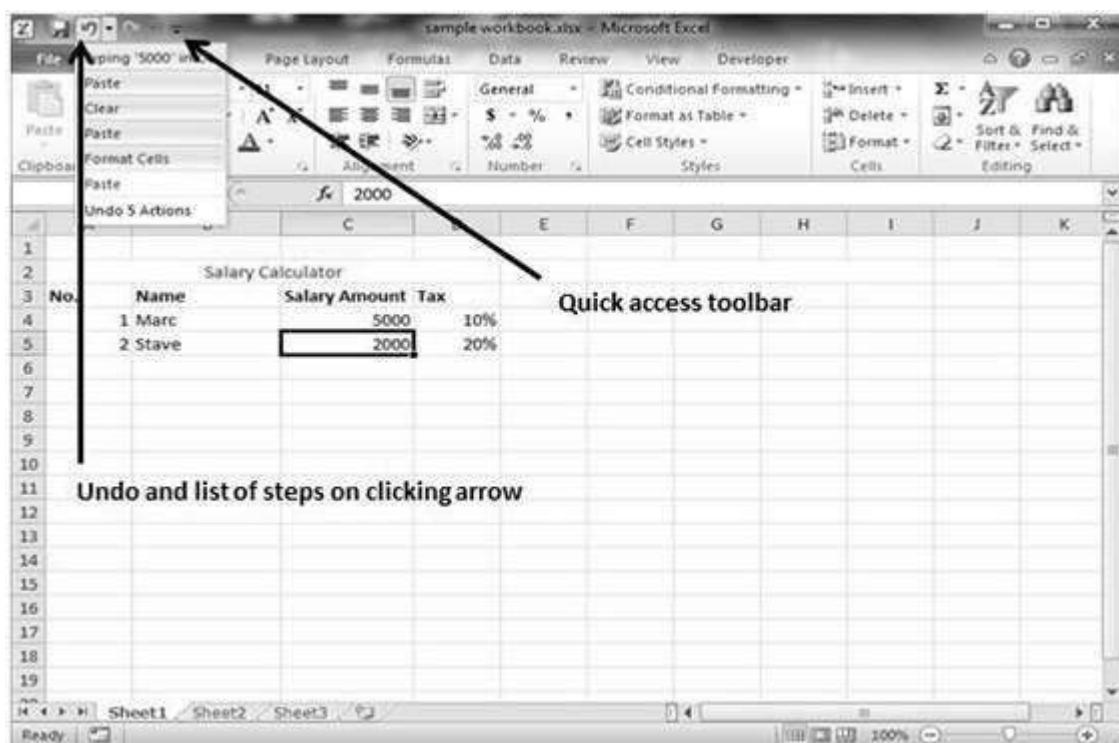

- **Fill:** Specifies the filling of text box like No fill, solid fill. Also specifying the transparency of text box fill.
- **Line Color:** Specifies the line color and transparency of the line.
- **Line Style:** Specifies the line style and width.
- **Size:** Specifies the size of the text box.
- **Properties:** Specifies some properties of the text box.
- **Text Box:** Specifies text box layout, Auto-fit option and internal margins.

Undo Changes

You can reverse almost every action in Excel by using the Undo command. We can undo changes in following two ways.

- From the Quick access tool-bar » Click Undo.
- Press Control + Z.

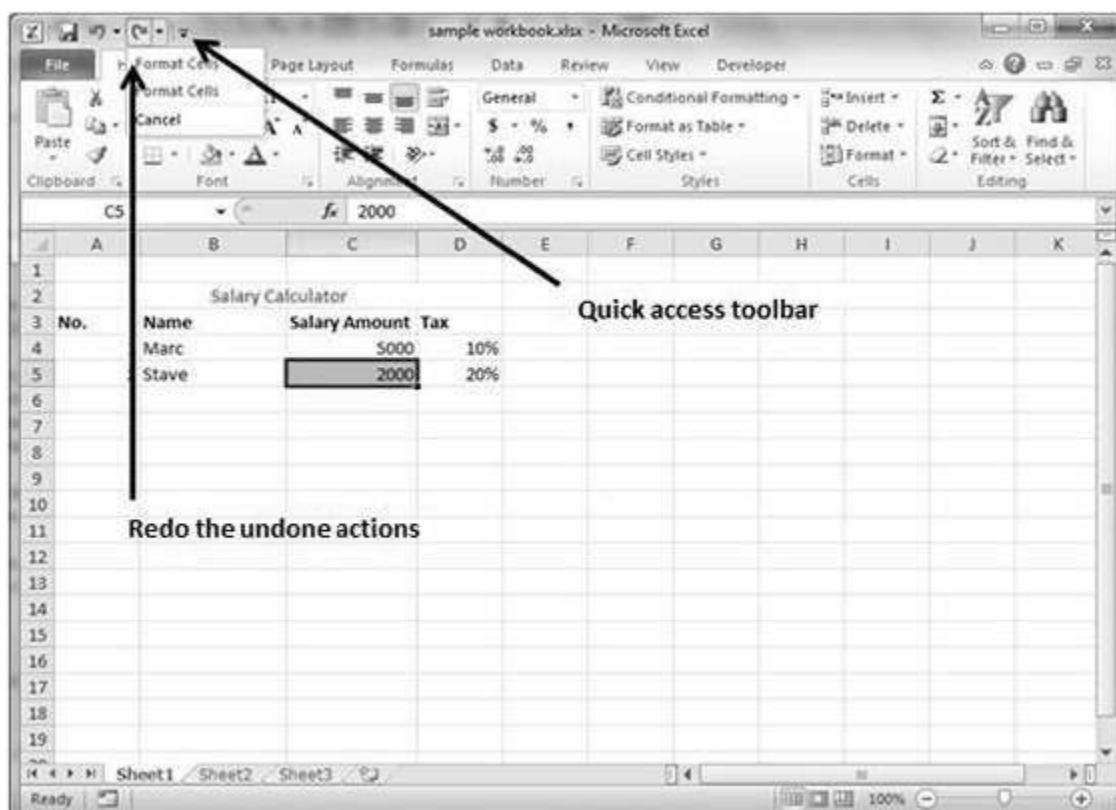

You can reverse the effects of the past 100 actions that you performed by executing Undo more than once. If you click the arrow on the right side of the

Undo button, you see a list of the actions that you can reverse. Click an item in that list to undo that action and all the subsequent actions you performed.

Redo Changes

You can again reverse back the action done with undo in Excel by using the Redo command. We can redo changes in following two ways.

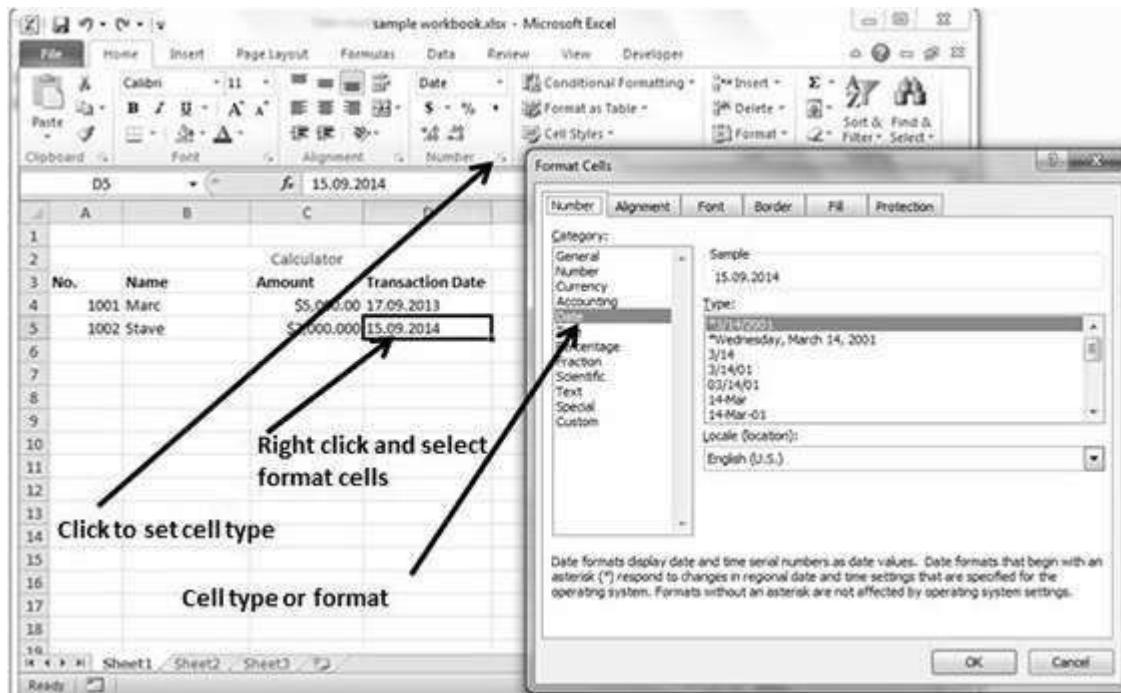

- From the Quick access tool-bar » Click Redo.
- Press Control + Y.

Formatting Cell

MS Excel Cell can hold different types of data like Numbers, Currency, Dates, etc. You can set the cell type in various ways as shown below:

- Right Click on the cell » Format cells » Number.
- Click on the Ribbon from the ribbon.

Various Cell Formats

Below are the various cell formats.

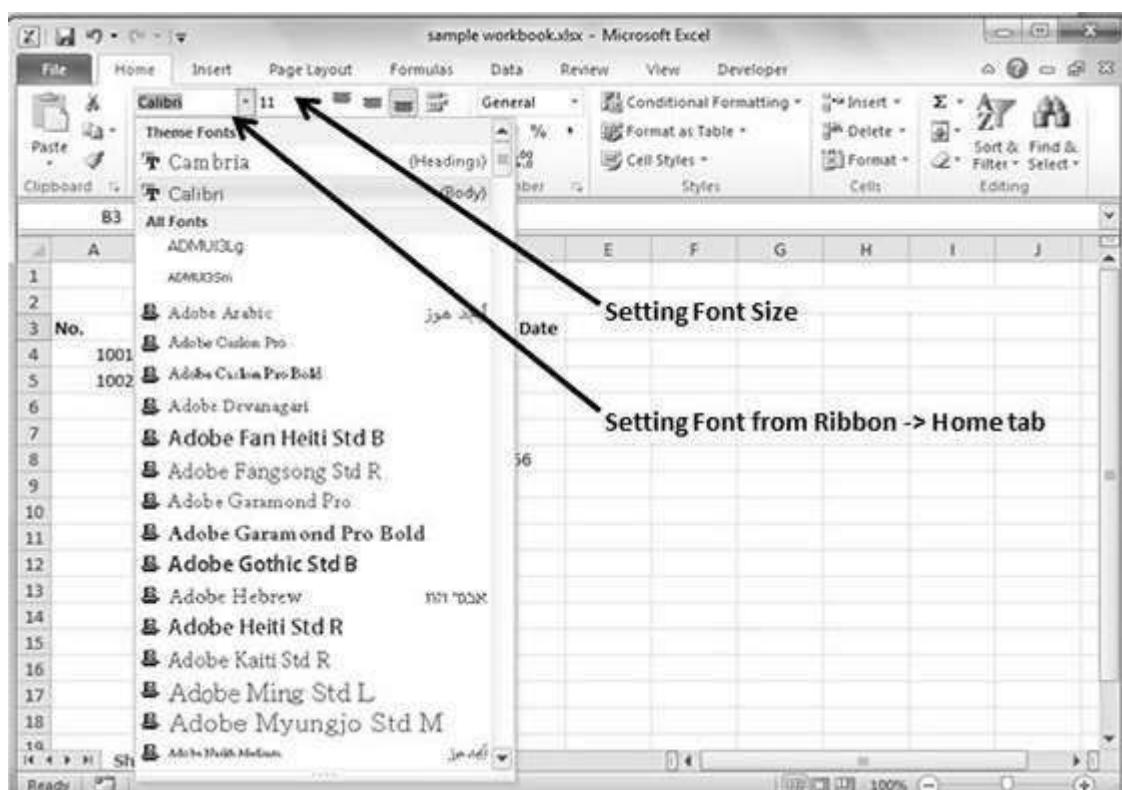

- **General:** This is the default cell format of Cell.
- **Number:** This displays cell as number with separator.
- **Currency:** This displays cell as currency i.e. with currency sign.
- **Accounting:** Similar to Currency, used for accounting purpose.
- **Date:** Various date formats are available under this, like 17-09-2013, 17th-Sep-2013, etc.
- **Time:** Various Time formats are available under this like 1.30PM, 13.30, etc.
- **Percentage:** This displays cell as percentage with decimal places like 50.00%.
- **Fraction:** This displays cell as fraction like 1/4, 1/2 etc.

- **Scientific:** This displays cell as exponential like 5.6E+01.
- **Text:** This displays cell as normal text.
- **Special:** Special formats of cell like Zip code, Phone Number.
- **Custom:** You can use custom format by using this.

You can assign any of the fonts that is installed for your printer to cells in a worksheet.

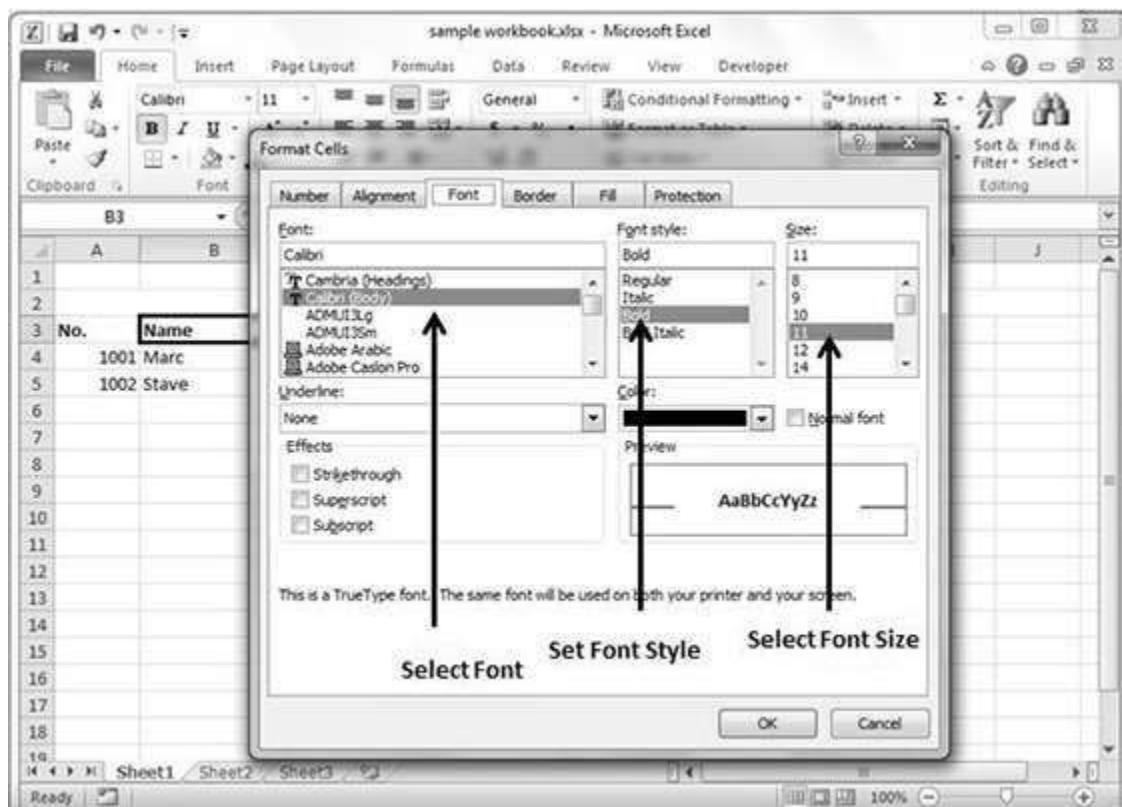

Setting Font from Home

You can set the font of the selected text from **Home** > **Font group** > **select the font**.

Setting Font from Format Cell Dialogue

- Right click on cell » Format cells » Font Tab
- Press Control + 1 or Shift + Control + F

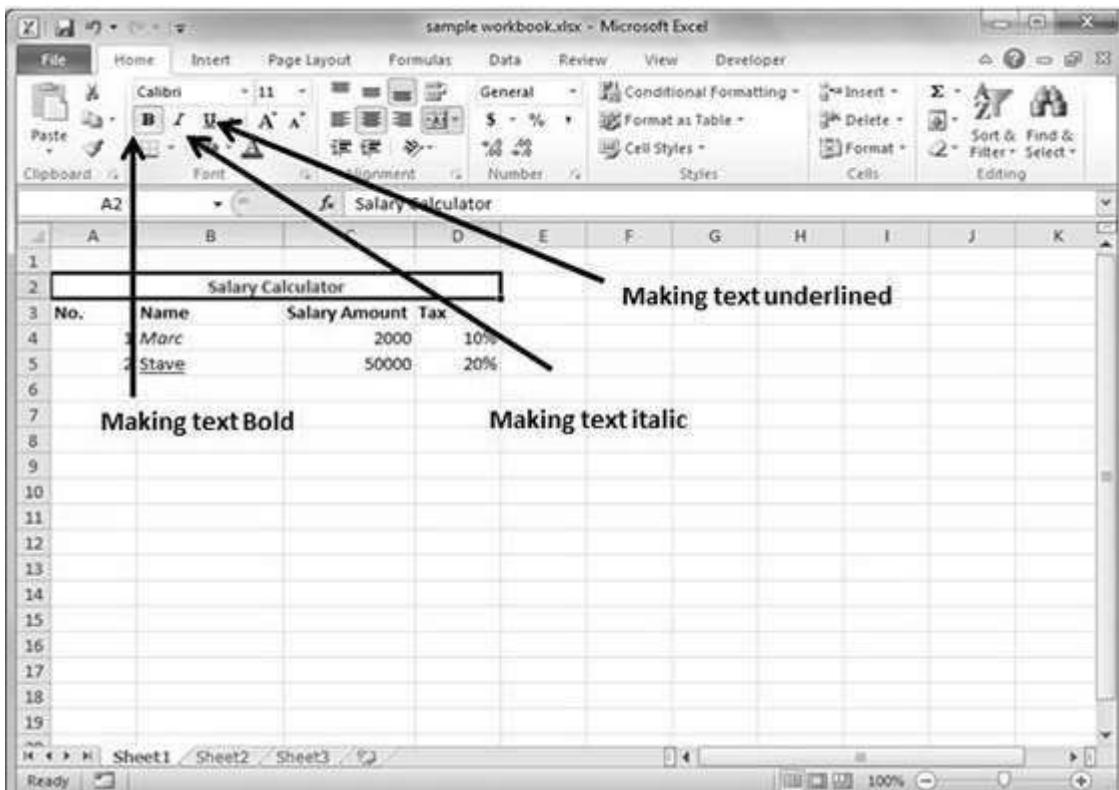

You can change the text decoration of the cell to change its look and feel.

Text-Decoration

Various options are available in Home tab of the ribbon as mentioned below.

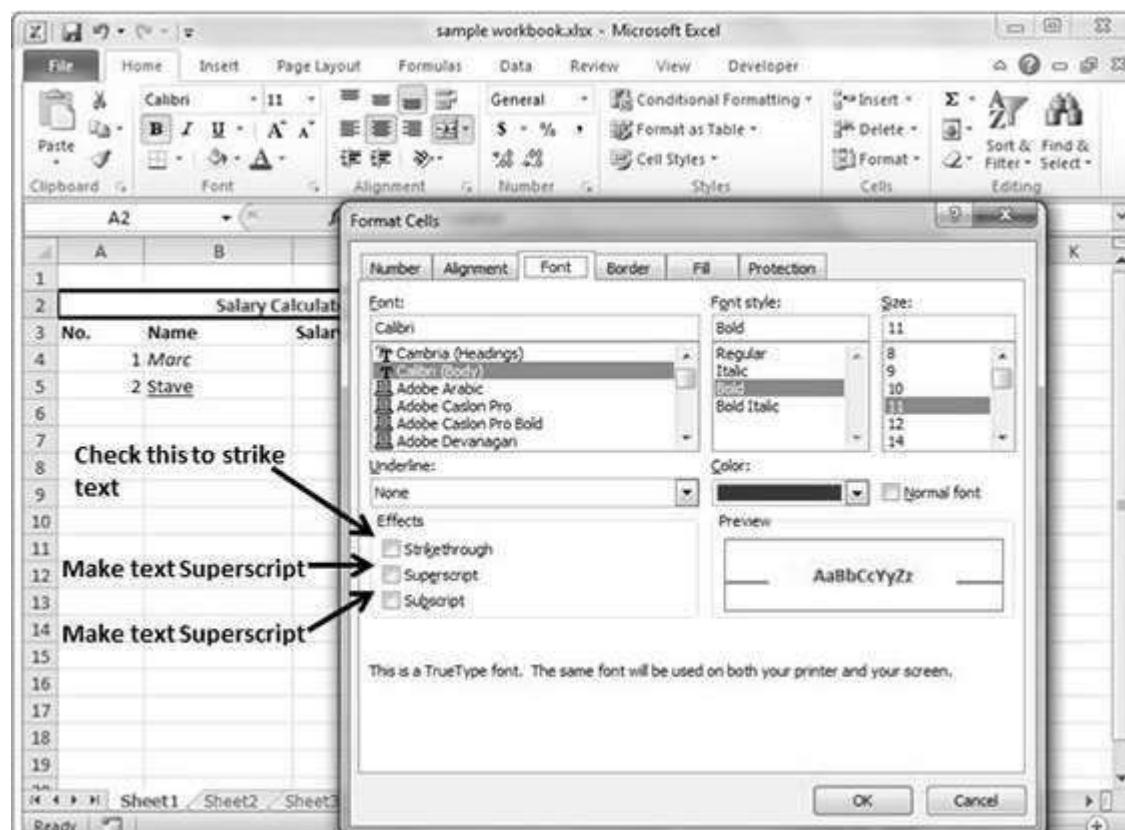

- **Bold:** It makes the text in bold by choosing **Home** » **Font Group** » **Click B** or Press **Control + B**.
- **Italic:** It makes the text italic by choosing **Home** » **Font Group** » **Click I** or Press **Control + B**.
- **Underline:** It makes the text as underlined by choosing **Home** » **Font Group** » **Click U** or Press **Control + B**.
- **Double Underline:** It makes the text highlighted as double underlined by choose **Home** » **Font Group** » **Click arrow near U** » **Select Double Underline**.

More Text-Decoration Options

There are more options available for text decoration in Formatting cells » Font Tab » Effects cells as mentioned below.

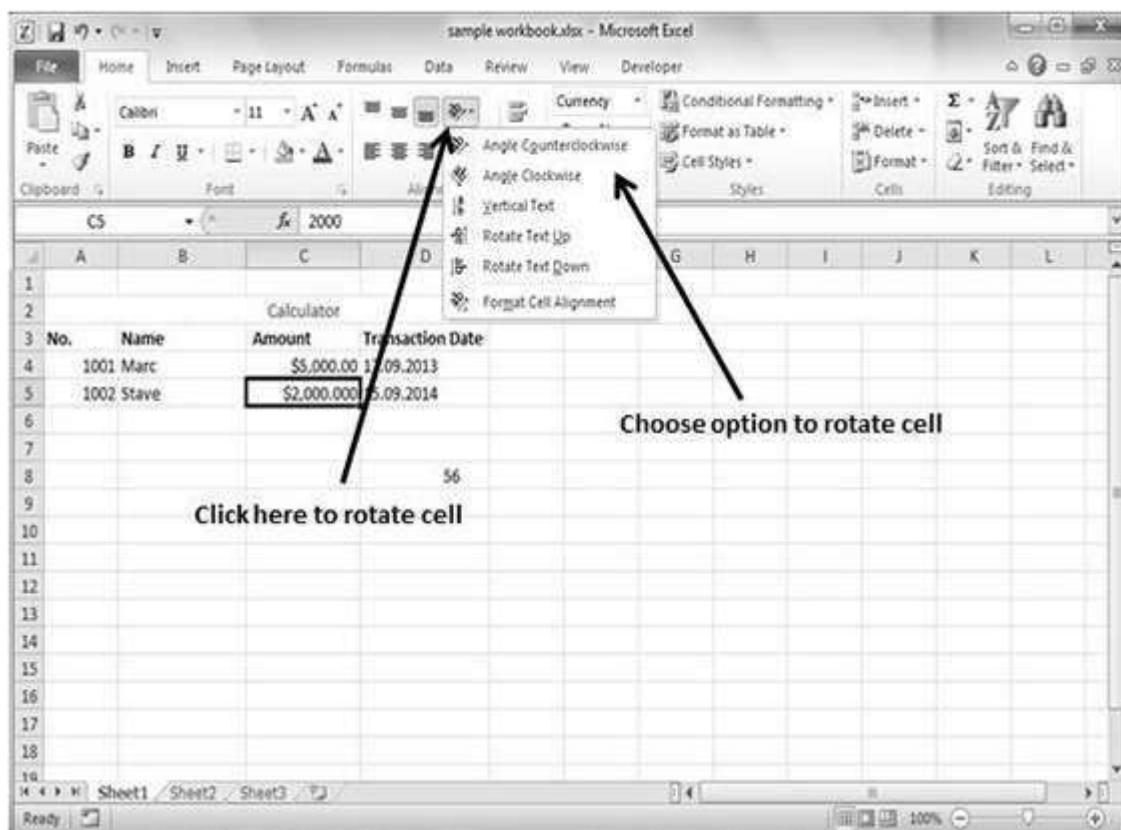

- **Strike-through:** It strikes the text in the center vertically.
- **Super Script:** It makes the content to appear as a super script.
- **Sub Script:** It makes content to appear as a sub script.

You can rotate the cell by any degree to change the orientation of the cell.

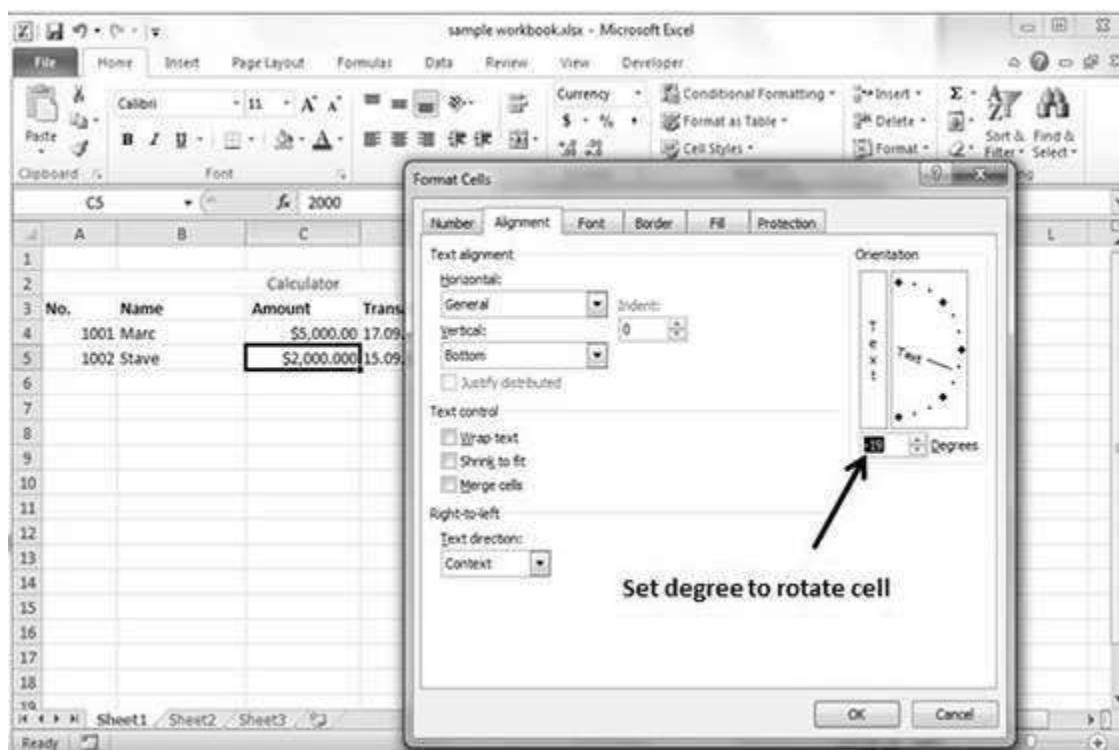

Rotating Cell from Home Tab

Click on the **orientation** in the **Home tab**. Choose options available like Angle Counter Clockwise, Angle Clockwise, etc.

Rotating Cell from Formatting Cell

Right Click on the cell. Choose Format cells » Alignment » Set the degree for rotation.

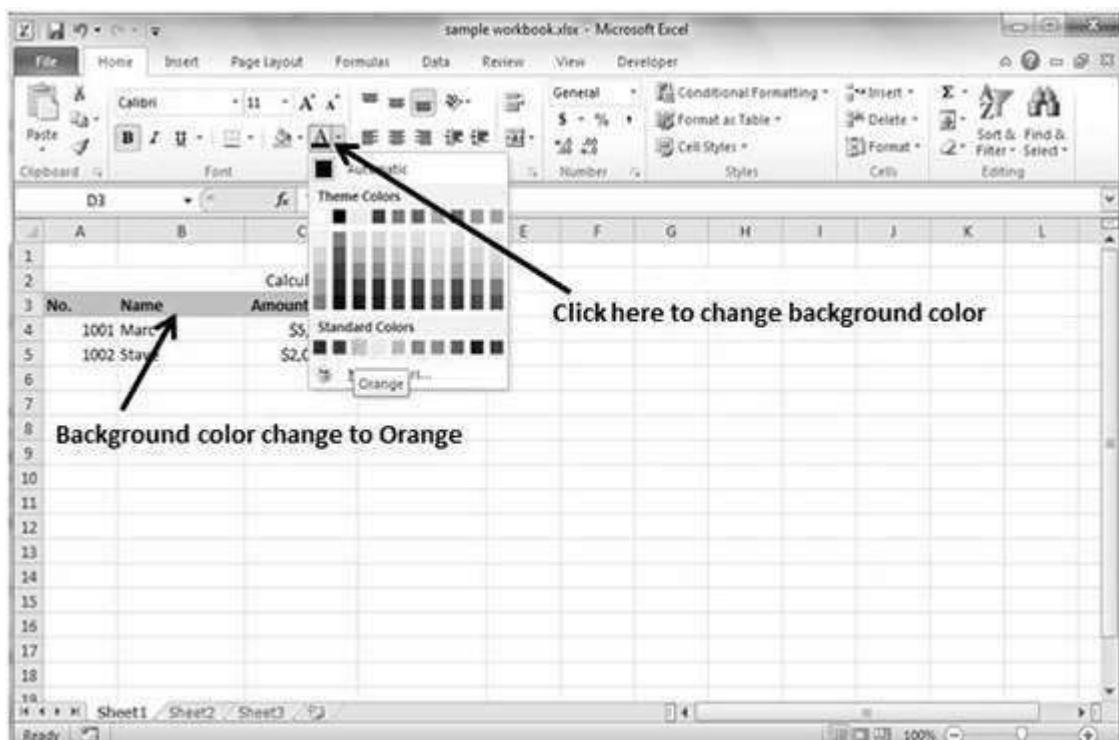

31. SETTING COLORS

You can change the background color of the cell or text color.

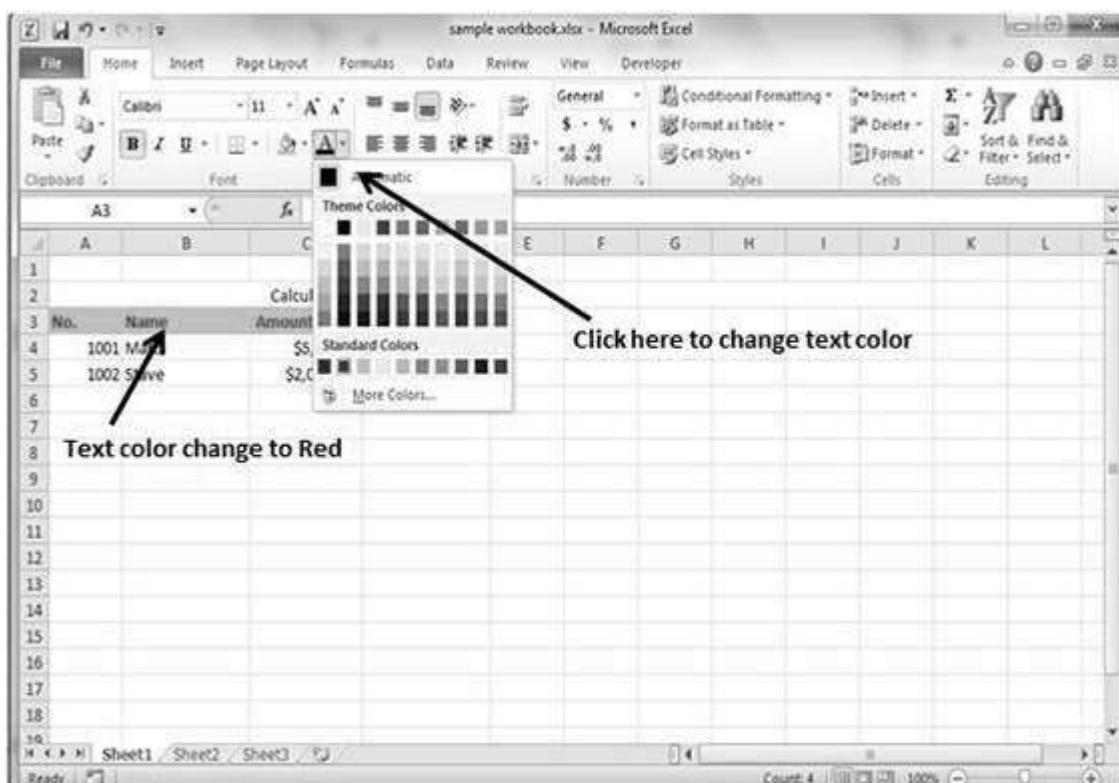

Changing Background Color

By default the background color of the cell is white in MS Excel. You can change it as per your need from **Home tab** » **Font group** » **Background color**.

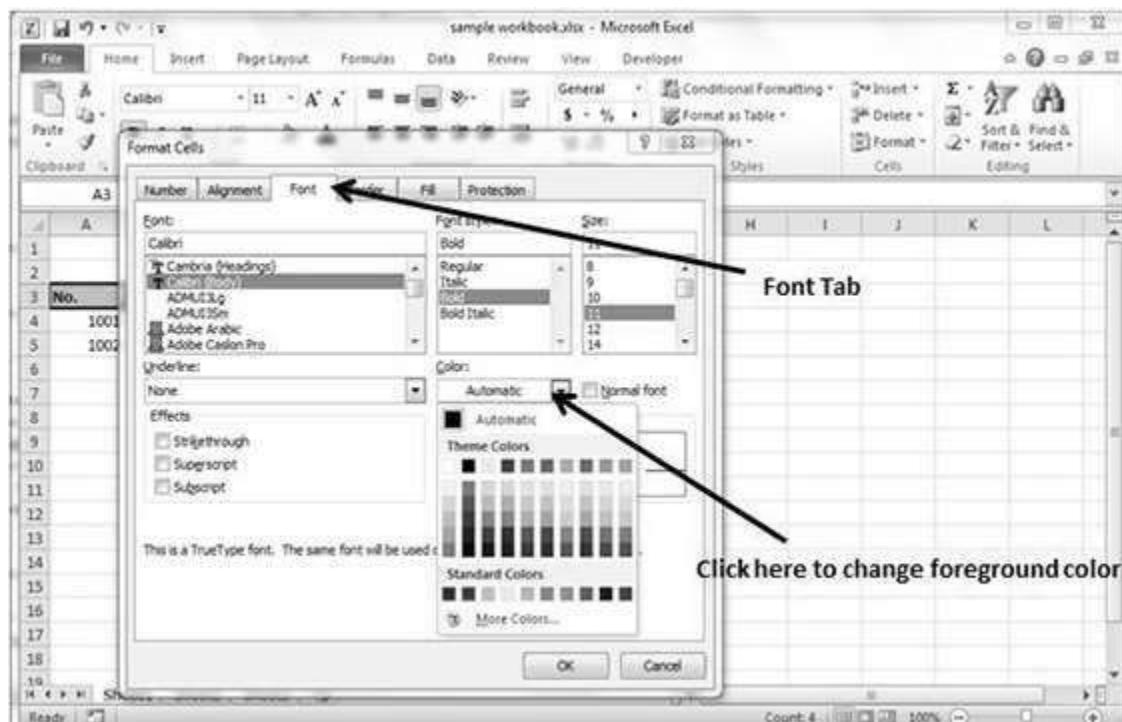

Changing Foreground Color

By default, the foreground or text color is black in MS Excel. You can change it as per your need from **Home tab** » **Font group** » **Foreground color**.

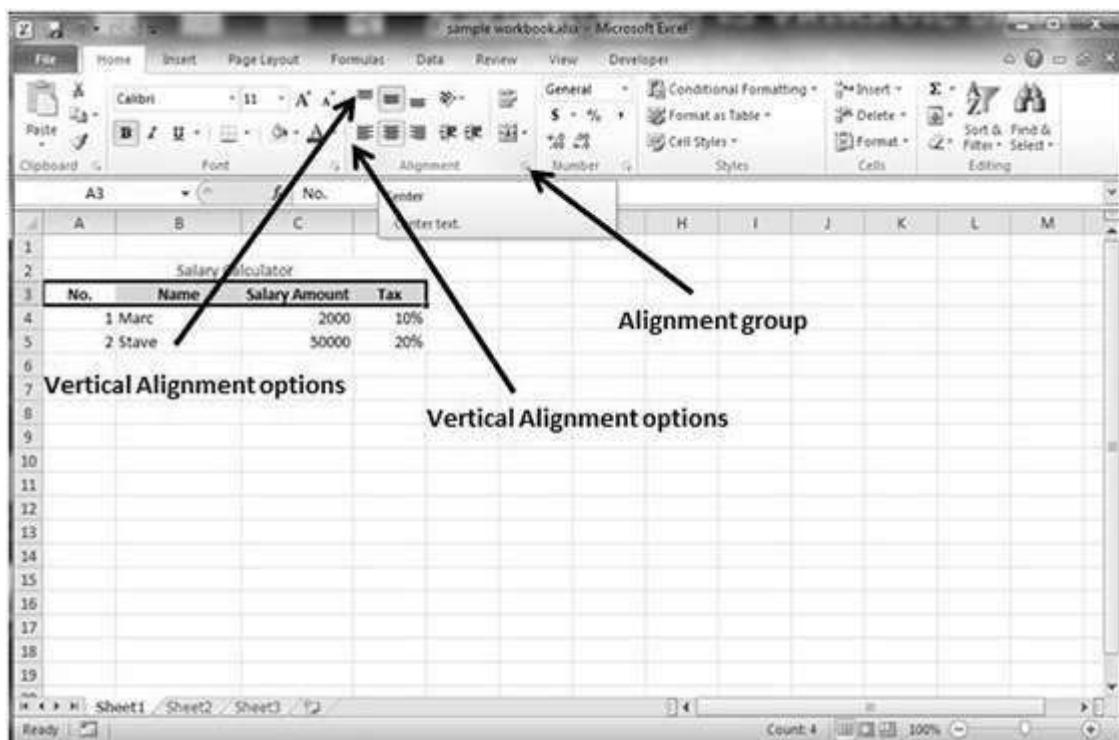

Also you can change the foreground color by selecting the cell **Right click** » **Format cells** » **Font Tab** » **Color**.

If you don't like the default alignment of the cell, you can make changes in the alignment of the cell. Below are the various ways of doing it.

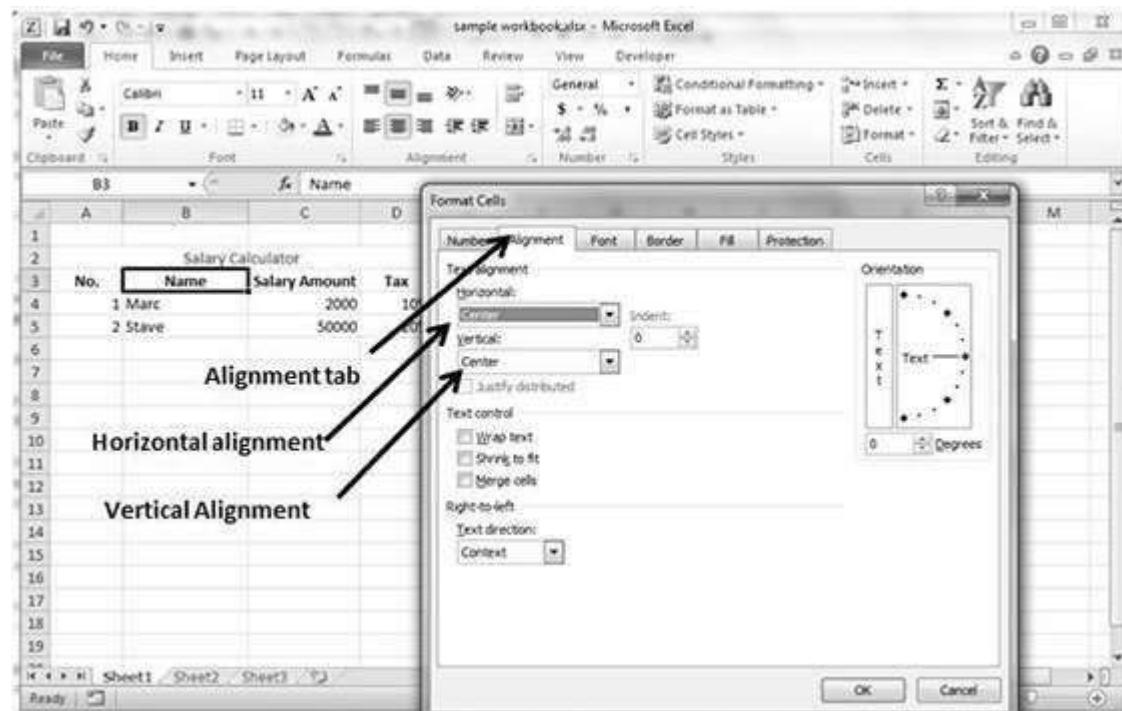

Change Alignment from Home Tab

You can change the Horizontal and vertical alignment of the cell. By default, Excel aligns numbers to the right and text to the left. Click on the available option in the Alignment group in Home tab to change alignment.

Change Alignment from Format Cells

Right click on the cell and choose format cell. In format cells dialogue, choose **Alignment Tab**. Select the available options from the Vertical alignment and Horizontal alignment options.

Exploring Alignment Options

1. Horizontal Alignment: You can set horizontal alignment to Left, Centre, Right, etc.

- **Left:** Aligns the cell contents to the left side of the cell.
- **Center:** Centers the cell contents in the cell.

- **Right:** Aligns the cell contents to the right side of the cell.
- **Fill:** Repeats the contents of the cell until the cell's width is filled.
- **Justify:** Justifies the text to the left and right of the cell. This option is applicable only if the cell is formatted as wrapped text and uses more than one line.

2. Vertical Alignment: You can set Vertical alignment to top, Middle, bottom, etc.

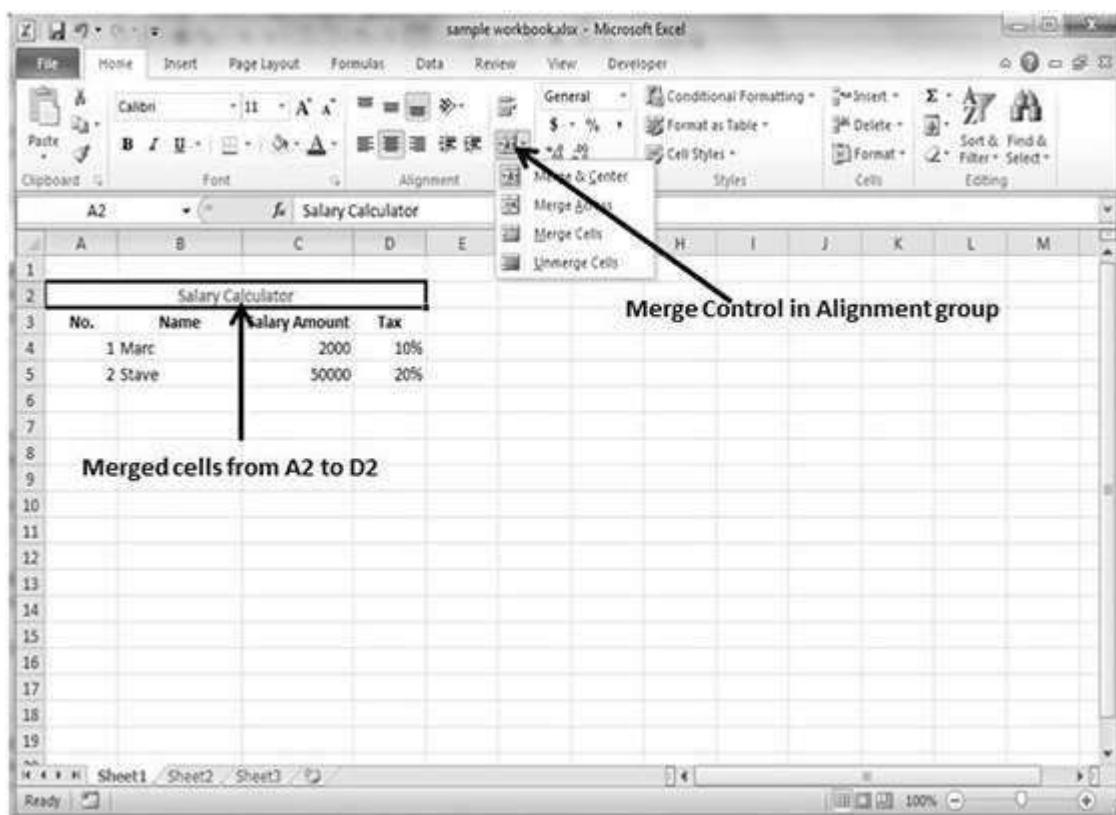

- **Top:** Aligns the cell contents to the top of the cell.
- **Center:** Centers the cell contents vertically in the cell.
- **Bottom:** Aligns the cell contents to the bottom of the cell.
- **Justify:** Justifies the text vertically in the cell; this option is applicable only if the cell is formatted as wrapped text and uses more than one line.

Merge Cells

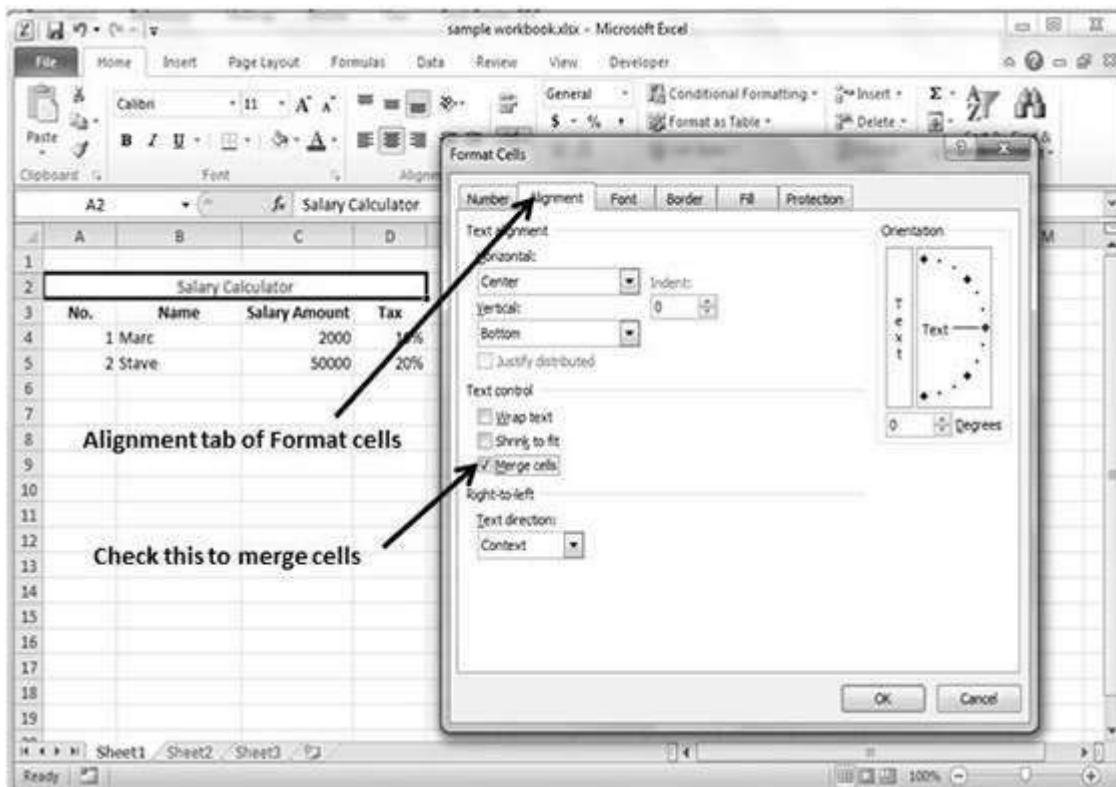

MS Excel enables you to merge two or more cells. When you merge cells, you don't combine the contents of the cells. Rather, you combine a group of cells into a single cell that occupies the same space.

You can merge cells by various ways as mentioned below.

- Choose **Merge & Center control** on the Ribbon, which is simpler. To merge cells, select the cells that you want to merge and then click the Merge & Center button.

- Choose **Alignment tab** of the Format Cells dialogue box to merge the cells.

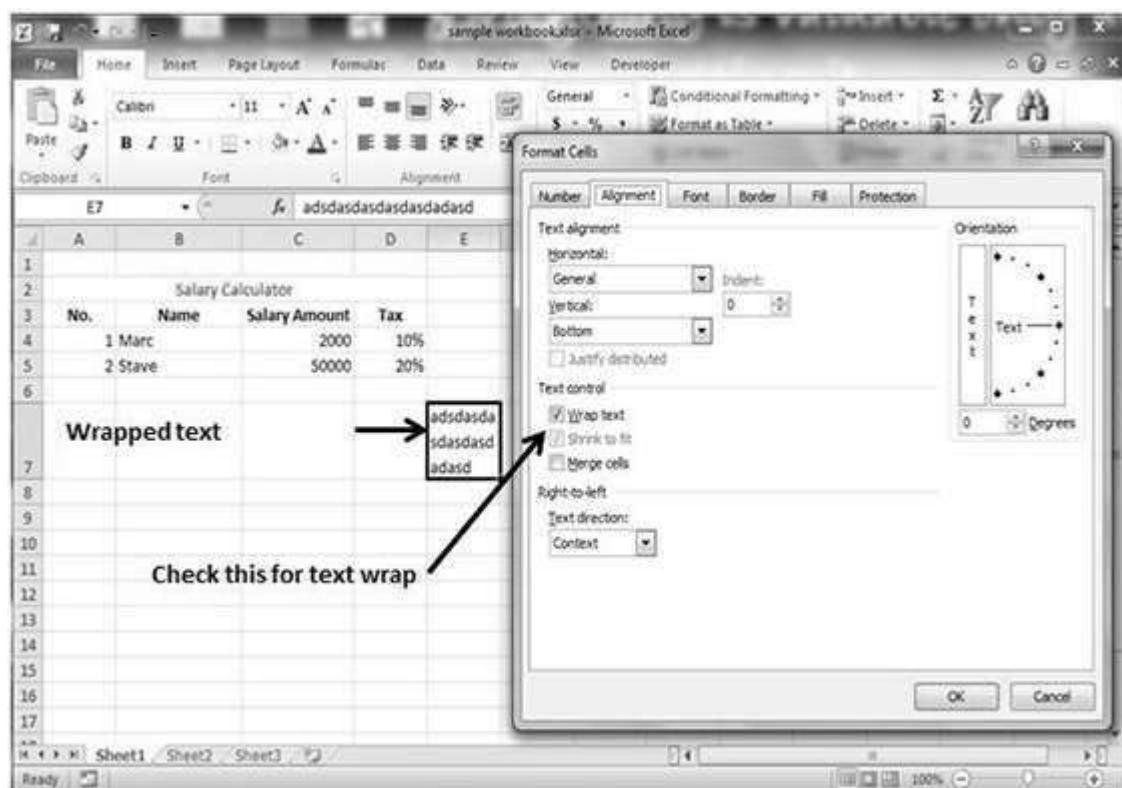

Additional Options

The **Home** » **Alignment group** » **Merge & Center control** contains a dropdown list with these additional options:

- **Merge Across:** When a multi-row range is selected, this command creates multiple merged cells — one for each row.
- **Merge Cells:** Merges the selected cells without applying the Center attribute.
- **Unmerge Cells:** Unmerges the selected cells.

Wrap Text and Shrink to Fit

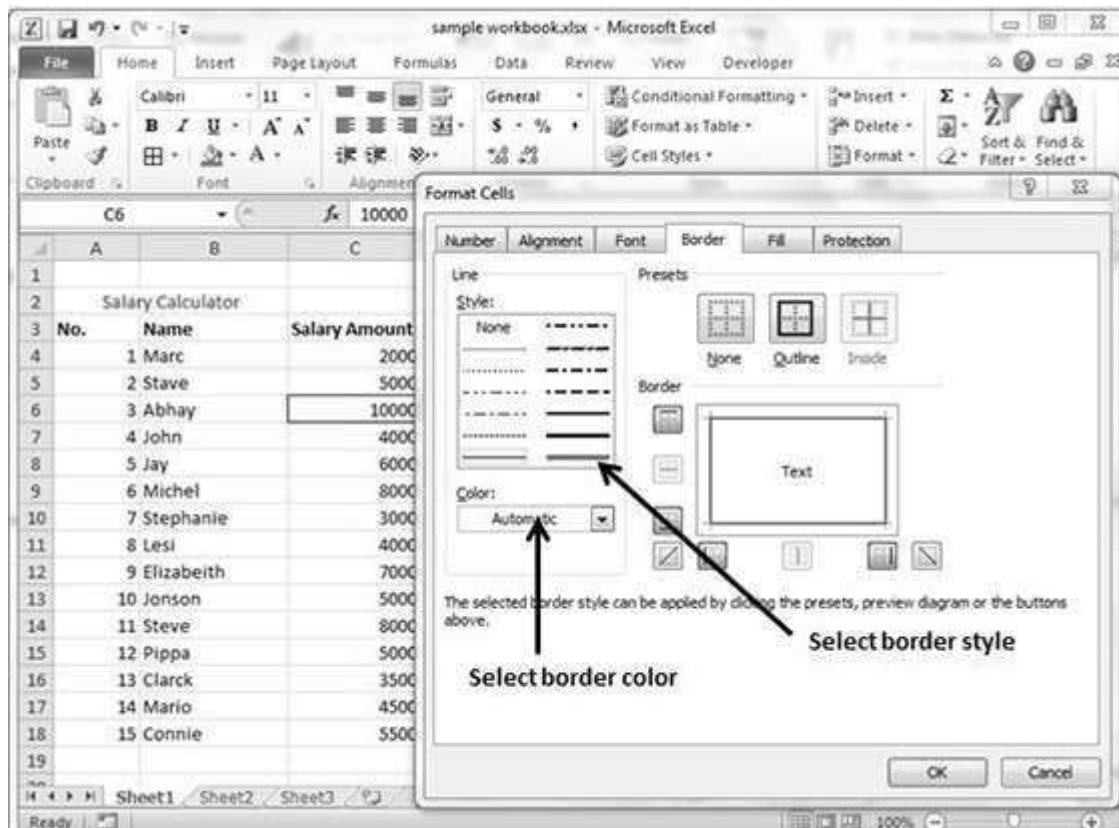

If the text is too wide to fit the column width but don't want that text to spill over into adjacent cells, you can use either the Wrap Text option or the Shrink to Fit option to accommodate that text.

34. BORDERS AND SHADS

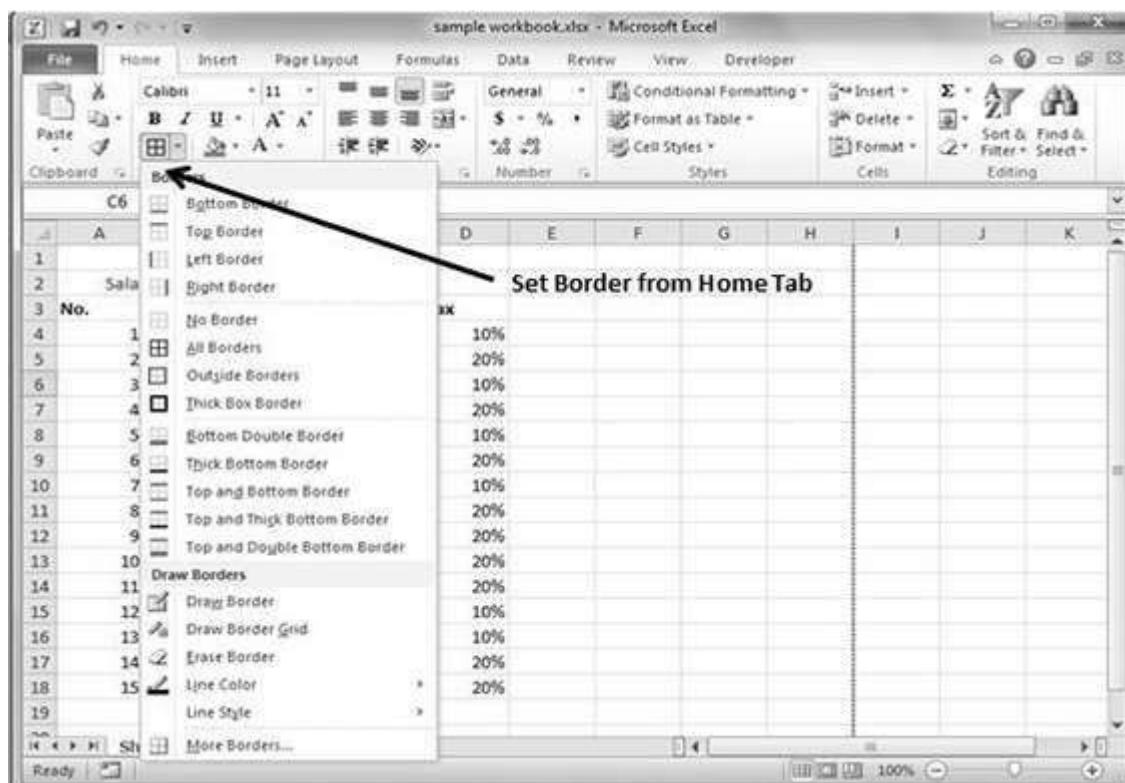

Apply Borders

MS Excel enables you to apply borders to the cells. For applying border, select the range of cells **Right Click** » **Format cells** » **Border Tab** » **Select the Border Style**.

Then you can apply border by Home Tab » Font group » Apply Borders.

Excel 2010

Apply Shading

You can add shading to the cell from the **Home tab** » **Font Group** » **Select the Color**.

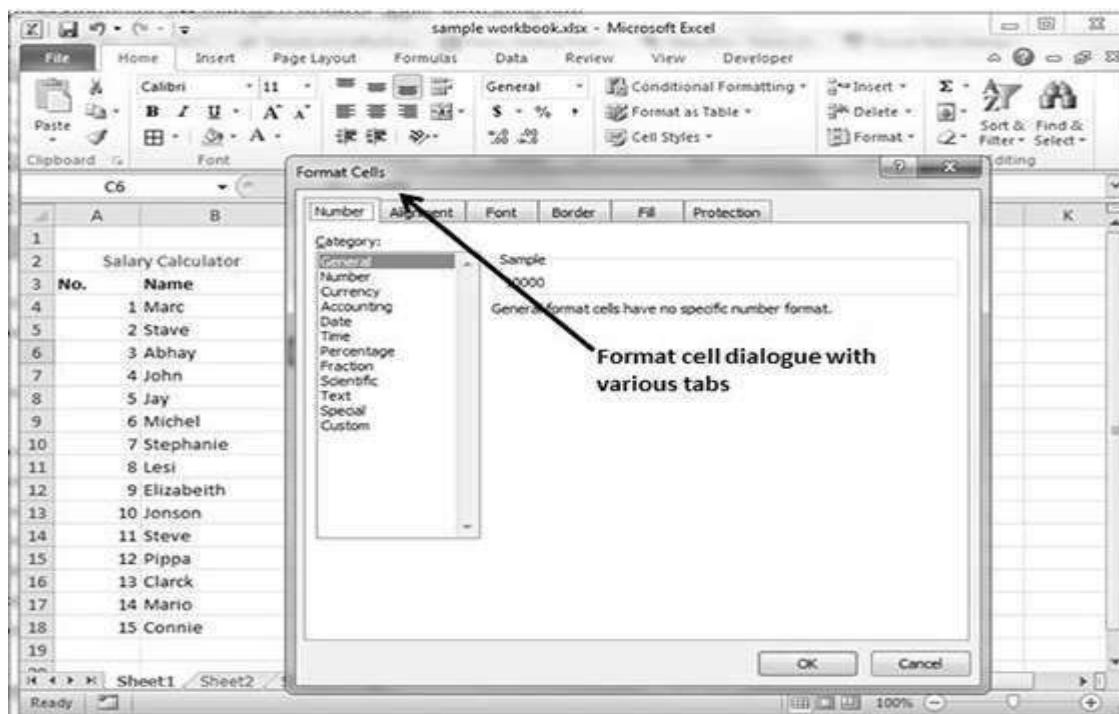

35. APPLY FORMATTING

The screenshot shows a Microsoft Excel spreadsheet titled "sample workbook.xlsx - Microsoft Excel". The ribbon at the top has the "Home" tab selected. In the center, there is a color palette with various shades of gray and black. A callout arrow points to this palette with the text "Select to apply shading". Below the palette, cell C13 is highlighted with a gray background, and a callout arrow points to it with the text "Shaded cell". The spreadsheet contains a table with columns "No.", "Name", and "Salary Calc". The data includes rows from 1 to 18, with values ranging from 10% to 5000.

No.	Name	Salary Calc
1	Marc	10%
2	Stave	20%
3	Abhay	10%
4	John	4000
5	Jay	6000
6	Michel	8000
7	Stephanie	3000
8	Lesi	4000
9	Elizabeth	7000
10	Jonson	5000
11	Steve	8000
12	Pippa	5000
13	Clarck	3500
14	Mario	4500
15	Connie	5500

Formatting Cells

In MS Excel, you can apply formatting to the cell or range of cells by **Right Click» Format cells» Select the tab**. Various tabs are available as shown below.

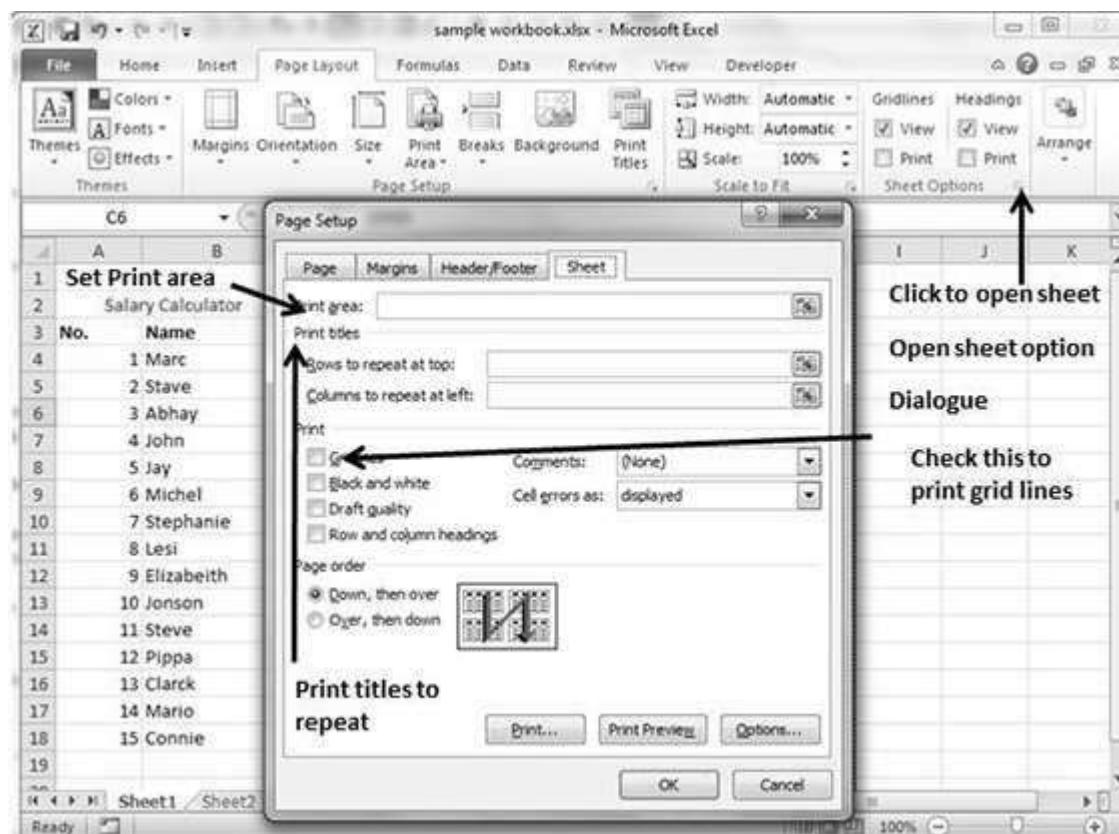

Alternative to Placing Background

- **Number:** You can set the Format of the cell depending on the cell content. Find tutorial on this at [MS Excel - Setting Cell Type](#).
- **Alignment:** You can set the alignment of text on this tab. Find tutorial on this at [MS Excel - Text Alignments](#).
- **Font:** You can set the Font of text on this tab. Find tutorial on this at [MS Excel - Setting Fonts](#).
- **Border:** You can set the border of cell with this tab. Find tutorial on this at [MS Excel - Borders and Shades](#).
- **Fill:** You can set fill of the cell with this tab. Find tutorial on this at [MS Excel - Borders and Shades](#).
- **Protection:** You can set cell protection option with this tab.

36. SHEET OPTIONS

Sheet Options

MS Excel provides various sheet options for printing purpose like generally cell gridlines aren't printed. If you want your printout to include the gridlines, Choose **Page Layout** » **Sheet Options group** » **Gridlines** » **Check Print**.

Options in Sheet Options Dialogue

- **Print Area:** You can set the print area with this option.
- **Print Titles:** You can set titles to appear at the top for rows and at the left for columns.
- **Print:**
 - **Gridlines:** Gridlines to appear while printing worksheet.
 - **Black & White:** Select this check box to have your color printer print the chart in black and white.

- **Draft quality:** Select this check box to print the chart using your printer's draft-quality setting.
 - **Rows & Column Heading:** Select this check box to have rows and column heading to print.
- **Page Order:**
 - **Down, then Over:** It prints the down pages first and then the right pages.
 - **Over, then Down:** It prints right pages first and then comes to print the down pages.

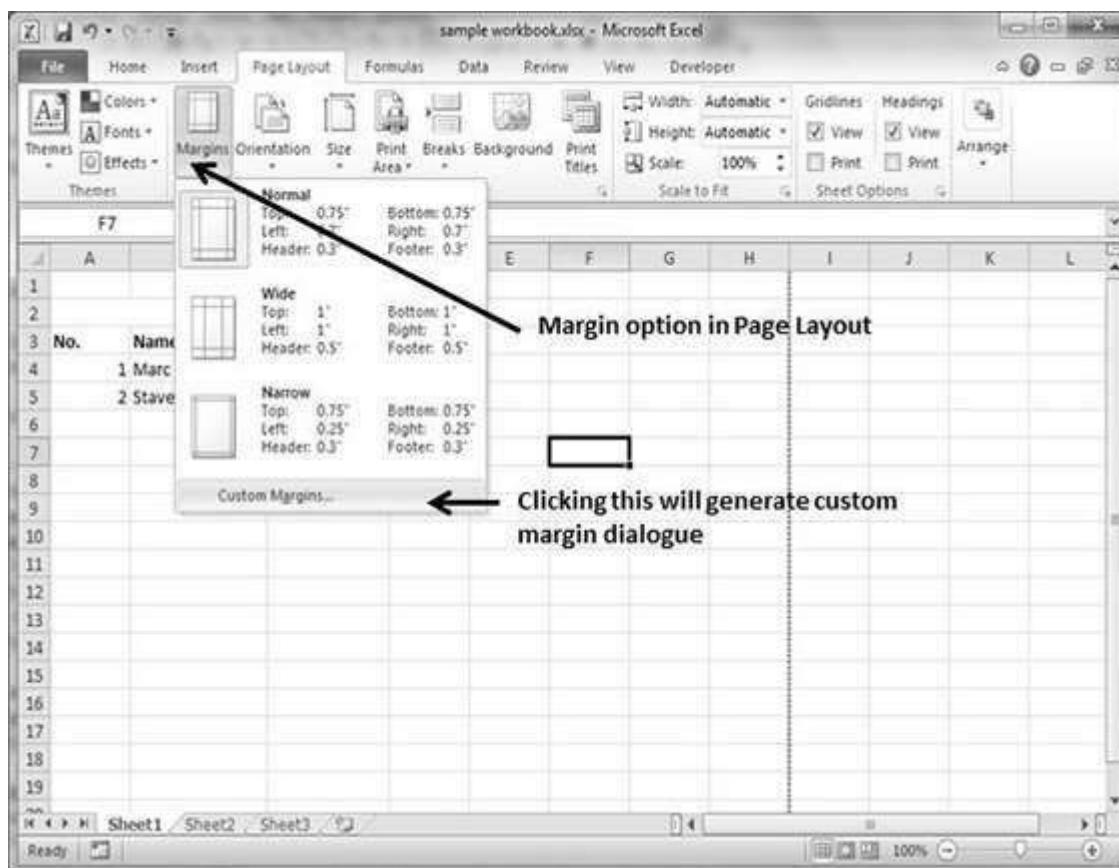

37. ADJUST MARGINS

Margins

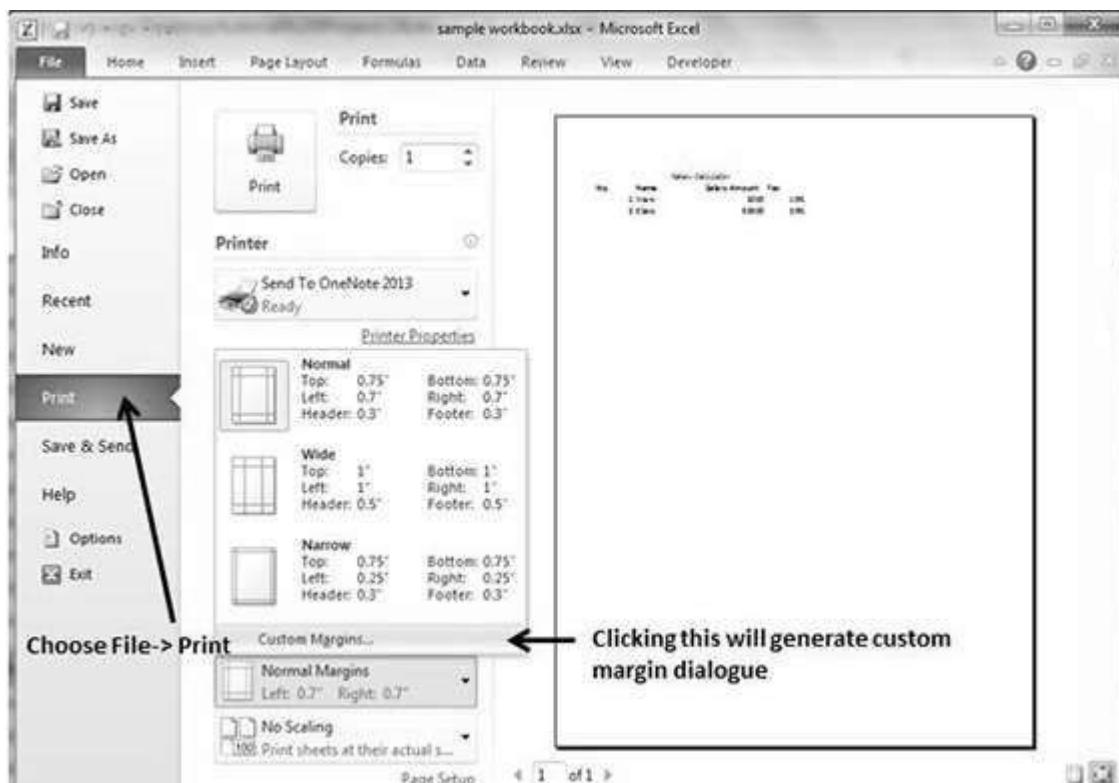

Margins are the unprinted areas along the sides, top, and bottom of a printed page. All printed pages in MS Excel have the same margins. You can't specify different margins for different pages.

You can set margins by various ways as explained below.

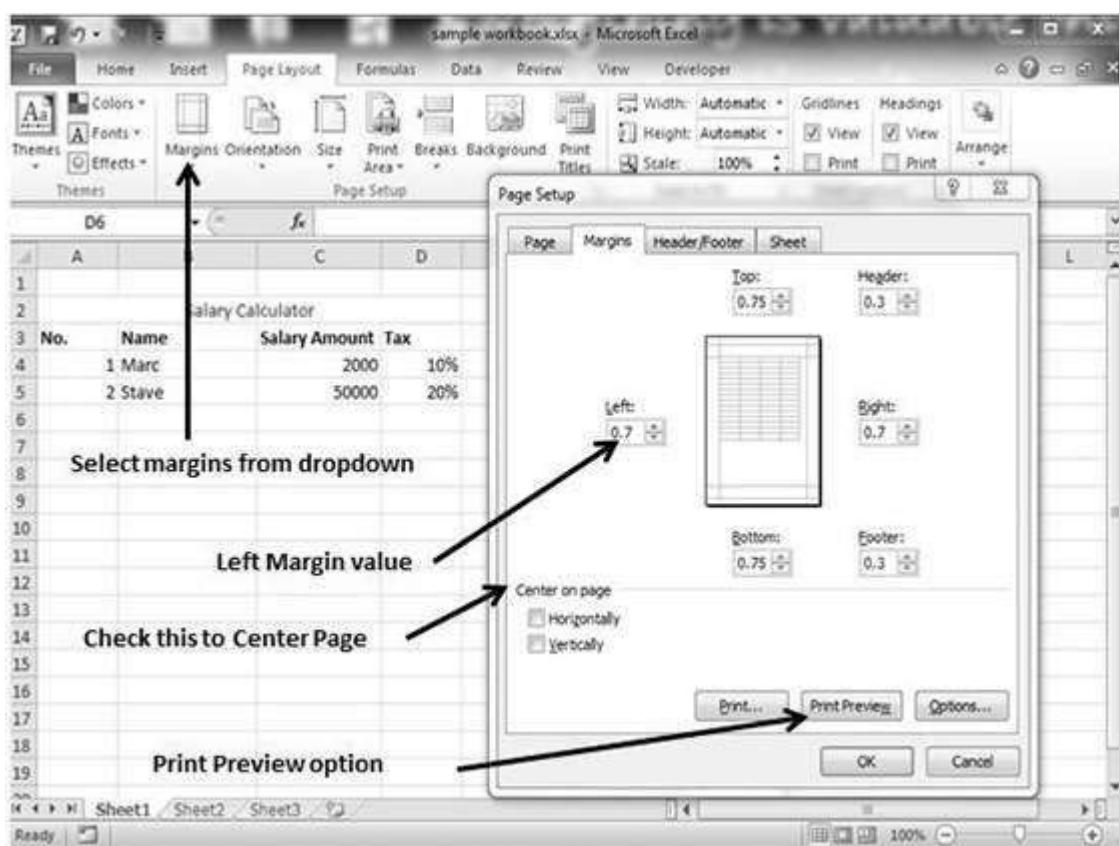

- Choose Page Layout » Page Setup » Margins drop-down list, you can select Normal, Wide, Narrow, or the custom Setting.

- These options are also available when you choose **File > Print**.

If none of these settings does the job, choose Custom Margins to display the Margins tab of the Page Setup dialog box, as shown below.

Center on Page

By default, Excel aligns the printed page at the top and left margins. If you want the output to be centered vertically or horizontally, select the appropriate check box in the Center on Page section of the Margins tab as shown in the above screenshot.

Page Orientation

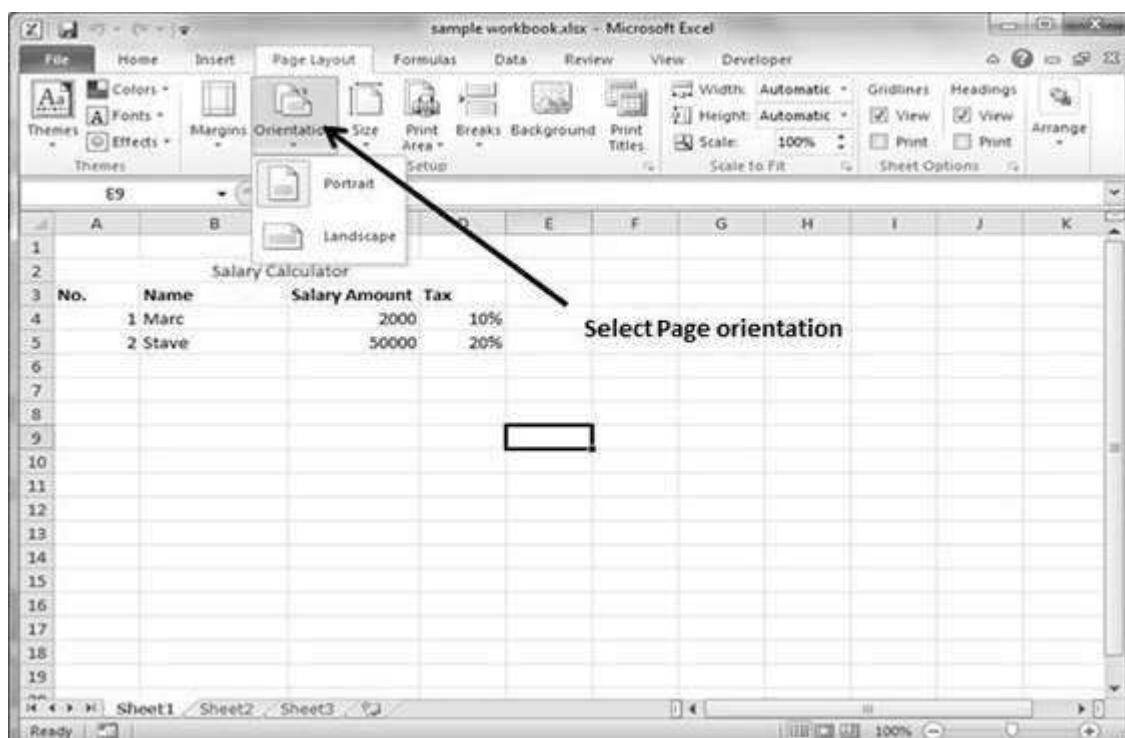

Page orientation refers to how output is printed on the page. If you change the orientation, the onscreen page breaks adjust automatically to accommodate the new paper orientation.

Types of Page Orientation

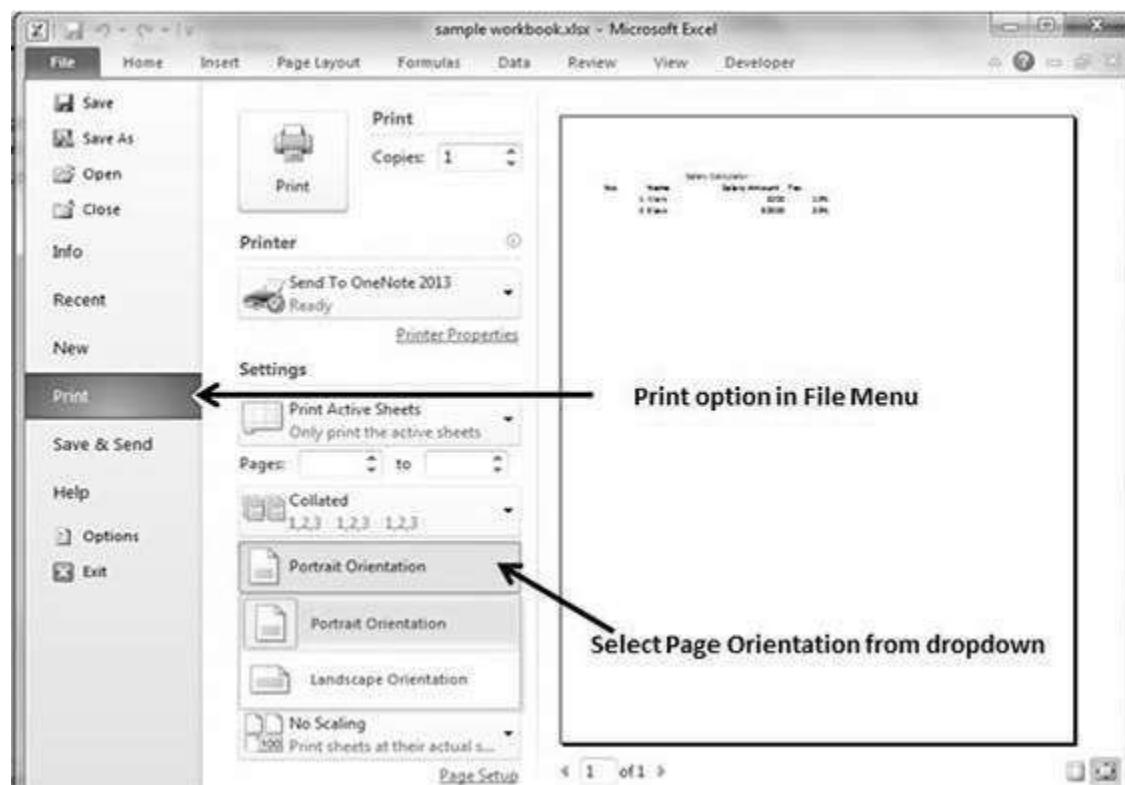

- **Portrait:** Portrait to print tall pages (the default).
- **Landscape:** Landscape to print wide pages. Landscape orientation is useful when you have a wide range that doesn't fit on a vertically oriented page.

Changing Page Orientation

- Choose Page Layout » Page Setup » Orientation » Portrait or Landscape.

- Choose File » Print.

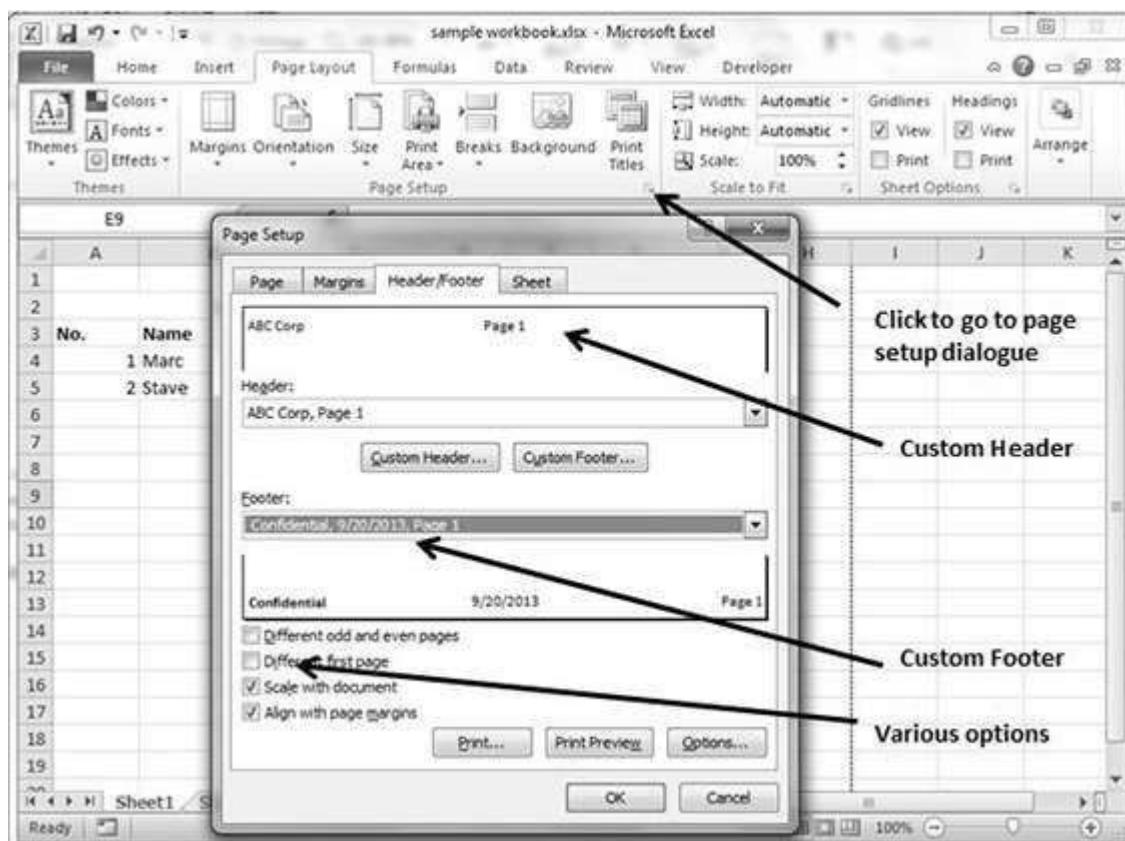

Header and Footer

A header is the information that appears at the top of each printed page and a footer is the information that appears at the bottom of each printed page. By default, new workbooks do not have headers or footers.

Adding Header and Footer

- Choose Page Setup dialog box » Header or Footer tab.

You can choose the predefined header and footer or create your custom ones.

- **&[Page]** : Displays the page number.
- **&[Pages]** : Displays the total number of pages to be printed.
- **&[Date]** : Displays the current date.
- **&[Time]** : Displays the current time.
- **&[Path]&[File]** : Displays the workbook's complete path and filename.
- **&[File]** : Displays the workbook name.
- **&[Tab]** : Displays the sheet's name.

Other Header and Footer Options

When a header or footer is selected in Page Layout view, the **Header & Footer** » **Design** » **Options** group contains controls that let you specify other options:

- **Different First Page**: Check this to specify a different header or footer for the first printed page.
- **Different Odd & Even Pages**: Check this to specify a different header or footer for odd and even pages.

- **Scale with Document:** If checked, the font size in the header and footer will be sized. Accordingly if the document is scaled when printed. This option is enabled, by default.
- **Align with Page Margins:** If checked, the left header and footer will be aligned with the left margin, and the right header and footer will be aligned with the right margin. This option is enabled, by default.

Page Breaks

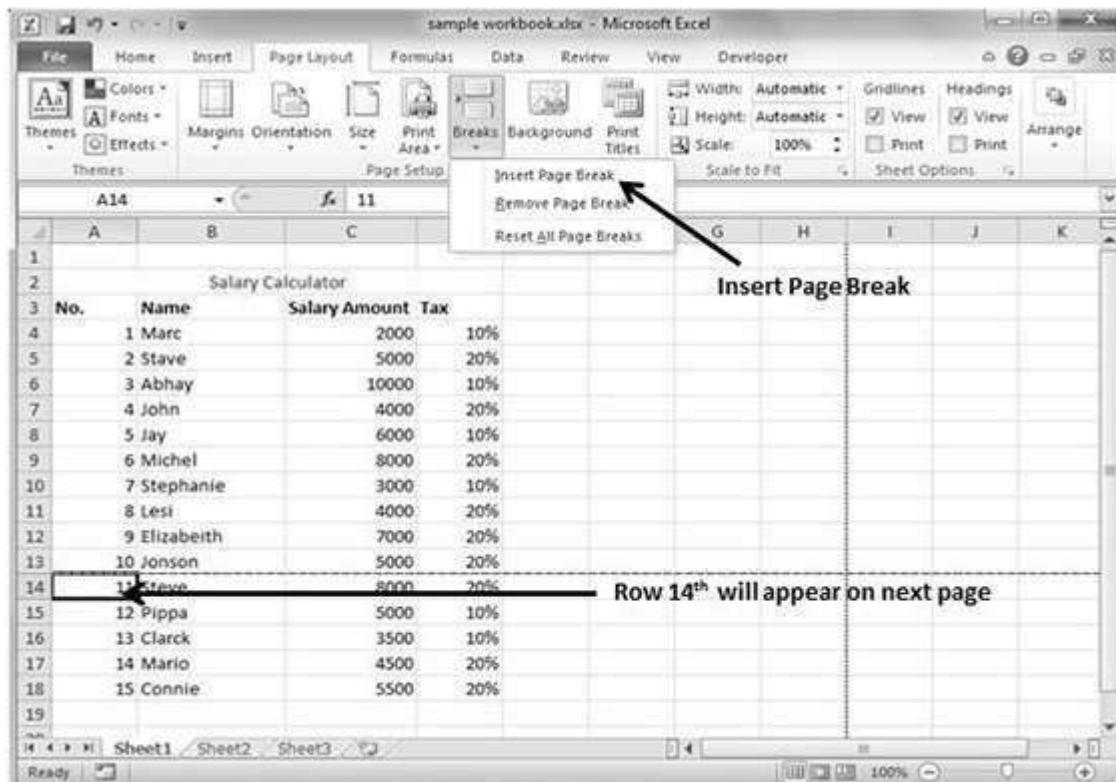

If you don't want a row to print on a page by itself or you don't want a table header row to be the last line on a page. MS Excel gives you precise control over **page breaks**.

MS Excel handles page breaks automatically, but sometimes you may want to force a page break **either a vertical or a horizontal one**, so that the report prints the way you want.

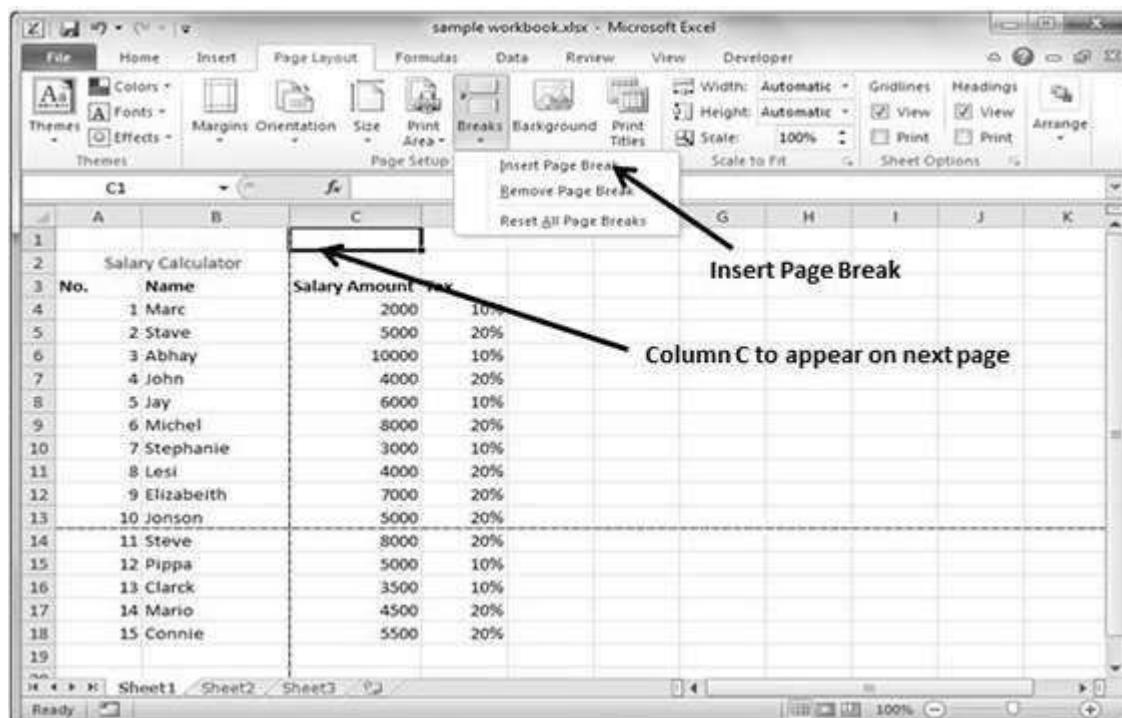

For example, if your worksheet consists of several distinct sections, you may want to print each section on a separate sheet of paper.

Inserting Page Breaks

Insert Horizontal Page Break: For example, if you want row 14 to be the first row of a new page, select cell A14. Then choose **Page Layout** » **Page Setup Group** » **Breaks**» **Insert Page Break**.

Insert vertical Page break: In this case, make sure to place the pointer in row 1. Choose **Page Layout** » **Page Setup** » **Breaks** » **Insert Page Break** to create the page break.

Removing Page Breaks

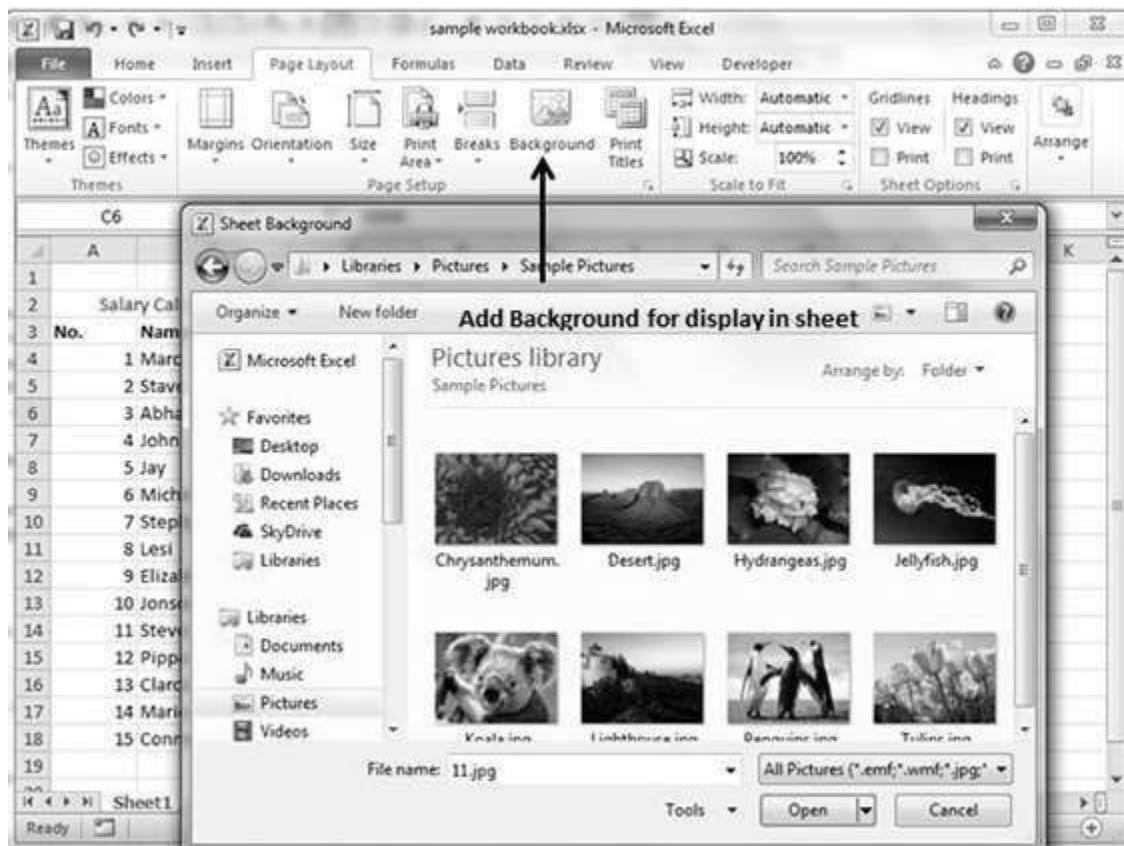

- **Remove a page break you've added:** Move the cell pointer to the first row beneath the manual page break and then choose Page Layout » Page Setup » Breaks » Remove Page Break.
- **Remove all manual page breaks:** Choose Page Layout » Page Setup » Breaks » Reset All Page Breaks.

Background Image

Unfortunately, you cannot have a background image on your printouts. You may have noticed the **Page Layout** » **Page Setup** » **Background** command. This button displays a dialogue box that lets you select an image to display as a background. Placing this control among the other print-related commands is very misleading. Background images placed on a worksheet are never printed.

Alternative to Placing Background

- You can insert a Shape, WordArt, or a picture on your worksheet and then adjust its transparency. Then copy the image to all printed pages.
- You can insert an object in a page header or footer.

42. FREEZE PANES

Freezing Panes

If you set up a worksheet with row or column headings, these headings will not be visible when you scroll down or to the right. MS Excel provides a handy solution to this problem with freezing panes. Freezing panes keeps the headings visible while you're scrolling through the worksheet.

Using Freeze Panes

Follow the steps mentioned below to freeze panes.

- Select the First row or First Column or the row Below, which you want to freeze, or Column right to area, which you want to freeze.
- Choose **View Tab** » **Freeze Panes**.
- Select the suitable option:

o **Freeze Panes:** To freeze area of cells. o **Freeze Top Row:**

To freeze first row of worksheet. o **Freeze First Column:** To freeze first Column of worksheet.

The screenshot shows a Microsoft Excel window with the ribbon at the top. The 'View' tab is selected. In the 'View' tab, there is a 'Freeze Panes' button with a dropdown arrow. A callout bubble points to the word 'options' in the dropdown menu. The menu contains three items:

- Freeze Panes**: Keep rows and columns visible while the rest of the worksheet scrolls (based on current selection).
- Freeze Top Row**: Keep the top row visible while scrolling through the rest of the worksheet.
- Freeze First Column**: Keep the first column visible while scrolling through the rest of the worksheet.

The main Excel window displays a table with columns for OrderID, CustomerLastname, Color, Quantity, and Price. The first row (OrderID 1) is highlighted in yellow, indicating it is the frozen row. The table has 20 rows of data.

	A1	OrderID			
1	OrderID	CustomerLastname	Color	Quantity	Price
2	1	Cagle	Green/Navy	3	10
3	2	Cantwell	Green/Navy	18	4
4	3	Snell	Green/Navy	24	5
5	4	Lunt	Green/Navy	9	45
6	5	Rentel	Green/Navy	3	67
7	6	Kennedy	Red/Navy	6	48
8	7	Miller	Green/Navy	9	49
9	8	Zanitsch-Prentice	Green/Navy	6	312
10	9	Zanitsch-Prentice	Red/Navy	0	0
11	10	Morrison	Green/Navy	24	58
12	11	Ritchie	Blue/Grey	18	630
13	12	Ritchie	Yellow/Grey	3	40
14	13	Ritchie	Green/Navy	6	120
15	14	cluxton	Red/Navy	9	450
16	15	marquardt	Green/Navy	12	70
17	16	marquardt	Blue/Grey	18	840
18	17	Brian	Green/Navy	0	60
19	18	Brian	Blue/Grey	3	0
20	19	Cordova	Green/Navy	6	23
				25	69
					150

- If you have selected Freeze top row you can see the first row appears at the top, after scrolling also. See the below screen-shot.

The screenshot shows a Microsoft Excel spreadsheet titled "sample workbook.xlsx - Microsoft Excel". The ribbon menu is visible at the top, with the "View" tab selected. A table of data is displayed in the main area, consisting of columns for OrderID, Customer Lastname, Color, Quantity, Price, and Total Amount. The first row of the table is highlighted in blue and appears to be frozen at the top of the screen. An annotation with an arrow points to this row with the text "First row appear on top".

OrderID	Customer Lastname	Color	Quantity	Price	Total Amount
14	13 Ritchie	Green/Navy	6	75	450
15	14 cluxton	Red/Navy	9	80	720
16	15 marquardt	Green/Navy	12	70	840
17	16 marquardt	Blue/Grey	18	60	1080
18	17 Brian	Green/Navy	0	10	0
19	18 Brian	Blue/Grey	3	23	69
20	19 Cordova	Green/Navy	6	25	150
21	20 Cordova	Yellow/Grey	3	10	30
22	21 Cordova	Blue/Grey	6	8	48
23	22 Livingston	Yellow/Grey	3	30	90
24	23 Andy	Green/Navy	18	100	1800
25	24 Arnold	Green/Navy	12	80	960
26	25 Bowly	Red/Navy	9	90	810
27	26 Mandel	Green/Navy	9	85	765
28	27 Mandel	Blue/Grey	9	75	675
29	28 Cottrell	Green/Navy	9	95	855
30	29 Chickey	Green/Navy	9	67	603
31	30 stash	Green/Navy	3	70	210

Unfreeze Panes

To unfreeze Panes, choose **View Tab** » **Unfreeze Panes**.

Conditional Formatting

MS Excel 2010 Conditional Formatting feature enables you to format a range of values so that the values outside certain limits, are automatically formatted.

Choose **Home Tab** » **Style group** » **Conditional Formatting dropdown**.

Various Conditional Formatting Options

- **Highlight Cells Rules:** It opens a continuation menu with various options for defining the formatting rules that highlight the cells in the cell selection

. 43 CONDITIONAL FORMATTING

that contain certain values, text, or dates, or that have values greater or less than a particular value, or that fall within a certain ranges of values.

Suppose you want to find cell with Amount 0 and Mark them as red. Choose Range of cell » Home Tab » Conditional Formatting DropDown » Highlight Cell Rules » Equal To.

The screenshot shows a Microsoft Excel spreadsheet titled "sample workbook.xlsx - Microsoft Excel". The spreadsheet contains a table with columns: OrderID, Customer, Lastname, Color, Quantity, Price, and Total Amount. The "Total Amount" column is highlighted. A "Conditional Formatting" dialog box is open over the spreadsheet, specifically the "Format cells that are EQUAL TO:" section. The input field contains "0" and the format is set to "Light Red Fill with Dark Red Text". The dialog box has "OK" and "Cancel" buttons.

	A	B	C	D	E	F	G	H	I	J
1	OrderID	Customer	Lastname	Color	Quantity	Price	Total Amount			
2	1	Cagle		Green/Navy	3	100	300			
3	2	Cantwell		Green/Navy	18	60	1080			
4	3	Snell		Green/Navy	24	50	1200			
5	4	Lunt		Green/Navy						
6	5	Rentel		Green/Navy						
7	6	Kennedy		Red/Navy						
8	7	Miller		Green/Navy						
9	8	Zanitsch-Prentice		Green/Navy						
10	9	Zanitsch-Prentice		Red/Navy						
11	10	Morrison		Green/Navy						
12	11	Ritchie		Blue/Grey	18	35	630			
13	12	Ritchie		Yellow/Grey	3	40	120			
14	13	Ritchie		Green/Navy	6	75	450			
15	14	cluxton		Red/Navy	9	80	720			
16	15	marquardt		Green/Navy	12	70	840			
17	16	marquardt		Blue/Grey	18	60	1080			
18	17	Brian		Green/Navy	0	10	0			
19	18	Brian		Blue/Grey	3	23	69			
20	19	Cordova		Green/Navy	6	25	150			

After Clicking ok, the cells with value zero are marked as red.

A screenshot of Microsoft Excel showing a table of order data. The table has columns for OrderID, Customer Lastname, Color, Quantity, Price, and Total Amount. The 'Total Amount' column is currently selected. The data shows various orders with their details and total amounts.

	A	B	C	D	E	F	G	H	I	J
1	OrderID	Customer Lastname	Color	Quantity	Price	Total Amount				
2	1	Cagle	Green/Navy	3	100	300				
3	2	Cantwell	Green/Navy	18	60	1080				
4	3	Snell	Green/Navy	24	50	1200				
5	4	Lunt	Green/Navy	9	45	405				
6	5	Rentel	Green/Navy	3	67	201				
7	6	Kennedy	Red/Navy	6	48	288				
8	7	Miller	Green/Navy	9	49	441				
9	8	Zanitsch-Prentice	Green/Navy	6	52	312				
10	9	Zanitsch-Prentice	Red/Navy	0	56	0				
11	10	Morrison	Green/Navy	24	58	1392				
12	11	Ritchie	Blue/Grey	18	35	630				
13	12	Ritchie	Yellow/Grey	3	40	120				
14	13	Ritchie	Green/Navy	6	75	450				
15	14	cluxton	Red/Navy	9	80	720				
16	15	marquardt	Green/Navy	12	70	840				
17	16	marquardt	Blue/Grey	18	60	1080				
18	17	Brian	Green/Navy	0	10	0				
19	18	Brian	Blue/Grey	3	23	69				
20	19	Cordova	Green/Navy	6	25	150				

- Top/Bottom Rules:** It opens a continuation menu with various options for defining the formatting rules that highlight the top and bottom values, percentages, and above and below average values in the cell selection.

Suppose you want to highlight the top 10% rows, you can do this with these Top/Bottom rules.

A screenshot of Microsoft Excel showing the 'Top 10%' dialog box open over the same table. The dialog box is titled 'Top 10%' and shows 'Format cells that rank in the TOP: 10 % with: Green Fill with Dark Green Text'. An annotation points to the dialog box with the text 'Top 10% Format cells that rank in the TOP: 10 % with: Green Fill with Dark Green Text'. Another annotation points to the table with the text 'Conditional Formatting of top 10% rows'. The table data remains the same as in the previous screenshot.

	A	B	C	D	E	F	G	H	I	J
1	OrderID	Customer Lastname	Color	Quantity	Price	Total Amount				
2	1	Cagle	Green/Navy	3	100	300				
3	2	Cantwell	Green/Navy	18	60	1080				
4	3	Snell	Green/Navy	24	50	1200				
5	4	Lunt	Green/Navy	9	45	405				
6	5	Rentel	Green/Navy	3	67	201				
7	6	Kennedy	Red/Navy	6	48	288				
8	7	Miller	Green/Navy	9	49	441				
9	8	Zanitsch-Prentice	Green/Navy	6	52	312				
10	9	Zanitsch-Prentice	Red/Navy	0	56	0				
11	10	Morrison	Green/Navy	24	58	1392				
12	11	Ritchie	Blue/Grey	18	35	630				
13	12	Ritchie	Yellow/Grey	3	40	120				
14	13	Ritchie	Green/Navy	6	75	450				
15	14	cluxton	Red/Navy	9	80	720				
16	15	marquardt	Green/Navy	12	70	840				
17	16	marquardt	Blue/Grey	18	60	1080				
18	17	Brian	Green/Navy	0	10	0				
19	18	Brian	Blue/Grey	3	23	69				
20	19	Cordova	Green/Navy	6	25	150				

Excel 2010

- Data Bars:** It opens a palette with different color data bars that you can apply to the cell selection to indicate their values relative to each other by clicking the data bar thumbnail.

With this conditional Formatting, data Bars will appear in each cell.

The screenshot shows a Microsoft Excel 2010 window with a data table titled "sample workbook.xlsx". The "Conditional Formatting" dropdown menu is open, and the "Data Bars" option is highlighted. A callout arrow points from the "Data Bars" label to the thumbnail in the palette. Another callout arrow points to a cell in the data table, with the text "Data Bar will appear" next to it. The data table contains columns for OrderID, Customer Lastname, Color, Quantity, and Price.

OrderID	Customer Lastname	Color	Quantity	Price
1	Cagle	Green/Navy	3	100
2	Cantwell	Green/Navy	18	60
3	Snell	Green/Navy	24	50
4	Lunt	Green/Navy	9	45
5	Rentel	Green/Navy	3	67
6	Kennedy	Red/Navy	6	48
7	Miller	Green/Navy	9	49
8	Zanitsch-Prentice	Green/Navy	6	52
9	Zanitsch-Prentice	Red/Navy	0	56
10	Morrison	Green/Navy	24	58
11	Ritchie	Blue/Grey	18	35
12	Ritchie	Yellow/Grey	3	40
13	Ritchie	Green/Navy	6	45
14	cluxton	Red/Navy	9	80
15	marquardt	Green/Navy	12	70
16	marquardt	Blue/Grey	18	60
17	Brian	Green/Navy	0	10
18	Brian	Blue/Grey	3	23
19	Cordova	Green/Navy	6	25

- Color Scales:** It opens a palette with different three- and two-colored scales that you can apply to the cell selection to indicate their values relative to each other by clicking the color scale thumbnail.

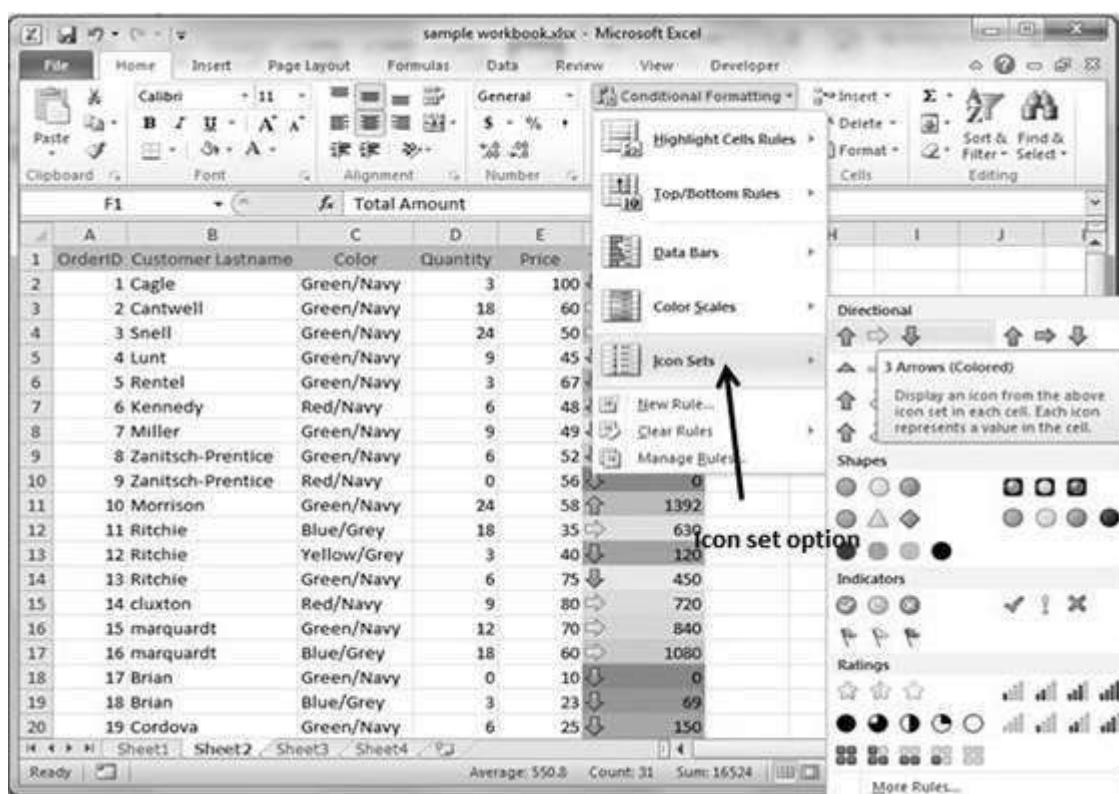

See the below screenshot with Color Scales, conditional formatting applied.

The screenshot shows a Microsoft Excel 2010 window with a data table titled "sample workbook.xlsx". The "Conditional Formatting" dropdown menu is open, and the "Color Scales" option is highlighted. A callout arrow points from the "Color Scales" label to the thumbnail in the palette. Another callout arrow points to a cell in the data table, with the text "Colored cells as per" followed by "Applying color scales" next to it. The data table contains columns for OrderID, Customer Lastname, Color, Quantity, and Price.

OrderID	Customer Lastname	Color	Quantity	Price
1	Cagle	Green/Navy	3	100
2	Cantwell	Green/Navy	18	60
3	Snell	Green/Navy	24	50
4	Lunt	Green/Navy	9	45
5	Rentel	Green/Navy	3	67
6	Kennedy	Red/Navy	6	48
7	Miller	Green/Navy	9	49
8	Zanitsch-Prentice	Green/Navy	6	52
9	Zanitsch-Prentice	Red/Navy	0	56
10	Morrison	Green/Navy	24	58
11	Ritchie	Blue/Grey	18	35
12	Ritchie	Yellow/Grey	3	40
13	Ritchie	Green/Navy	6	45
14	cluxton	Red/Navy	9	80
15	marquardt	Green/Navy	12	70
16	marquardt	Blue/Grey	18	60
17	Brian	Green/Navy	0	10
18	Brian	Blue/Grey	3	23
19	Cordova	Green/Navy	6	25

- **Icon Sets:** It opens a palette with different sets of icons that you can apply to the cell selection to indicate their values relative to each other by clicking the icon set.

See the below screenshot with Icon Sets, conditional formatting applied.

- **New Rule:** It opens the New Formatting Rule dialog box, where you define a custom conditional formatting rule to apply to the cell selection.
- **Clear Rules:** It opens a continuation menu, where you can remove the conditional formatting rules for the cell selection by clicking the Selected Cells option, for the entire worksheet by clicking the Entire Sheet option, or for just the current data table by clicking the This Table option.
- **Manage Rules:** It opens the Conditional Formatting Rules Manager dialog box, where you edit and delete particular rules as well as adjust their rule precedence by moving them up or down in the Rules list box.

Formulas in MS Excel

Formulas are the Bread and butter of worksheet. Without formula, worksheet will be just simple tabular representation of data. A formula consists of special code, which is entered into a cell. It performs some calculations and returns a result, which is displayed in the cell.

Formulas use a variety of operators and worksheet functions to work with values and text. The values and text used in formulas can be located in other cells, which makes changing data easy and gives worksheets their dynamic nature. For example, you can quickly change the data in a worksheet and formulas works.

Elements of Formulas

A formula can consist of any of these elements:

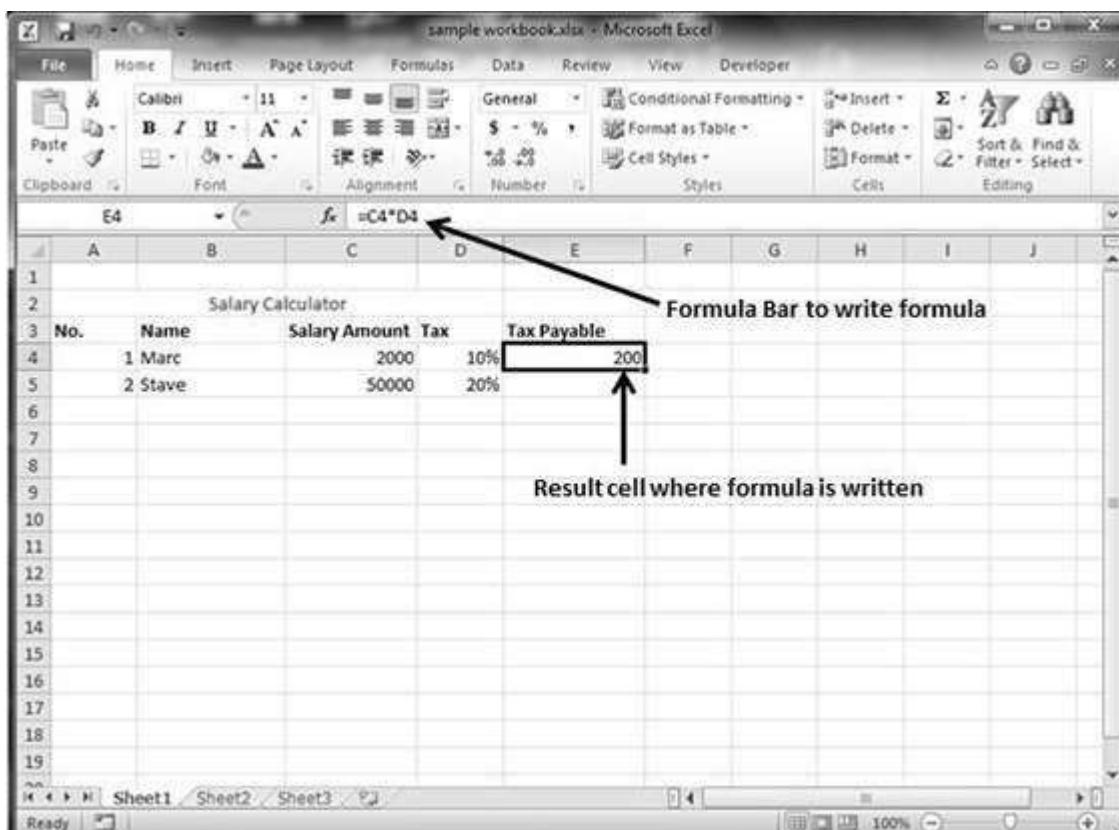

- **Mathematical operators, such as +(for addition) and *(for multiplication)**

Example:

- =A1+A2 Adds the values in cells A1 and A2.
- **Values or text**
Example:
 - =200*0.5 Multiplies 200 times 0.15. This formula uses only values, and it always returns the same result as 100.
- **Cell references (including named cells and ranges)**
Example:
 - =A1=C12 Compares cell A1 with cell C12. If the cells are identical, the formula returns TRUE; otherwise, it returns FALSE.
- **Worksheet functions (such as SUM or AVERAGE) Example:**
 - =SUM(A1:A12) Adds the values in the range A1:A12.

Creating Formula

For creating a formula, you need to type in the Formula Bar. Formula begins with '=' sign. When building formulas manually, you can either type in the cell addresses or you can point to them in the worksheet. Using the **Pointing method** to supply the cell addresses for formulas is often easier and more powerful method of formula building. When you are using built-in functions, you click the cell or drag through the cell range that you want to use when defining the function's arguments in the Function Arguments dialog box. See the below screen shot.

As soon as you complete a formula entry, Excel calculates the result, which is then displayed inside the cell within the worksheet (the contents of the formula, however, continue to be visible on the Formula bar anytime the cell is active). If you make an error in the formula that prevents Excel from being able to calculate the formula at all, Excel displays an Alert dialog box suggesting how to fix the problem.

Copying Formulas in MS Excel

Copying formulas is one of the most common tasks that you do in a typical spreadsheet that relies primarily on formulas. When a formula uses cell references rather than constant values, Excel makes the task of copying an original formula to every place that requires a similar formula.

Relative Cell Addresses

MS Excel does it automatically adjusting the cell references in the original formula to suit the position of the copies that you make. It does this through a system known as **relative cell addresses**, where by the column references in the cell address in the formula change to suit their new column position and the row references change to suit their new row position.

Let us see this with the help of example. Suppose we want the sum of all the rows at last, then we will write a formula for first column i.e. B. We want sum of the rows from 3 to 8 in the 9th row.

sample workbook.xlsx - Microsoft Excel

B9 fx =SUM(B3:B8)

	A	B	C	D	E	F	G	H	I	J	K

Formula bar showing formula

Drag this to right cells to copy formula with relative cell addressing

After writing formula in the 9th row, we can drag it to remaining columns and the formula gets copied. After dragging we can see the formula in the remaining columns as below.

- **column C :** =SUM(C3:C8)
- **column D :** =SUM(D3:D8)
- **column E :** =SUM(E3:E8)
- **column F :** =SUM(F3:F8)
- **column G :** =SUM(G3:G8)

A screenshot of Microsoft Excel 2010 showing a sales data table. The table has columns for Part No. and months from Jan-13 to Jun-13, plus a Total Sale column. Row 9 is labeled 'Total Sale'. The formula bar at the top shows '=SUM(C3:C8)'. A large black arrow points from the text 'Copied Formula with dragging using relative addressing' down to cell C9, which contains the value '1995'. Another smaller arrow points from the text 'Formula bar showing formula' up to the formula bar.

	Sales Q1-Q2						
	Jan-13	Feb-13	Mar-13	Apr-13	May-13	Jun-13	Total Sale
Part No.	204	200	180	170	230	245	1229
Part 101	248	300	280	230	210	200	1458
Part 102	674	600	450	400	450	400	2974
Part 103	656	195	300	350	320	315	2136
Part 104	180	300	295	270	315	328	1688
Part 105	200	400	410	435	401	392	2238
Total Sale	1995	1915	1845	1921	1880		

Cell References in Formulas

Most formulas you create include references to cells or ranges. These references enable your formulas to work dynamically with the data contained in those cells or ranges. For example, if your formula refers to cell C2 and you change the value contained in C2, the formula result reflects new value automatically. If you didn't use references in your formulas, you would need to edit the formulas themselves in order to change the values used in the formulas.

When you use a cell (or range) reference in a formula, you can use three types of references: relative, absolute, and mixed references.

Relative Cell References

The row and column references can change when you copy the formula to another cell because the references are actually offsets from the current row and column. By default, Excel creates relative cell references in formulas.

The screenshot shows a Microsoft Excel 2010 window with a spreadsheet titled "sample workbook.xlsx". The formula bar at the top displays the formula =SUM(B3:B8). A red arrow points from the text "Formula using relative references" to the formula bar. Another red arrow points from the text "Resultcell" to the cell B9, which contains the value 2162. The spreadsheet has a header row and data for six parts (Part 100 to Part 105) across six months (Jan-13 to Jun-13), with a total sale column and a Grand Total cell B9.

	A	B	C	D	E	F	G	H	I	J	K
1		Sales of 2013									
2	Part No.	Jan-13	Feb-13	Mar-13	Apr-13	May-13	Jun-13	Total Sale			
3	Part 100	204	200	180	176	230	245	1229			
4	Part 101	248	300	280	220	210	200	1458			
5	Part 102	674	600	450	400	450	400	2974			
6	Part 103	656	195	300	350	320	315	2136			
7	Part 104	180	300	295	270	315	328	1688			
8	Part 105	200	400	410	435	405	392	2238			
9	Total	2162	1995	1915	1845	1926	1880				

Absolute Cell References

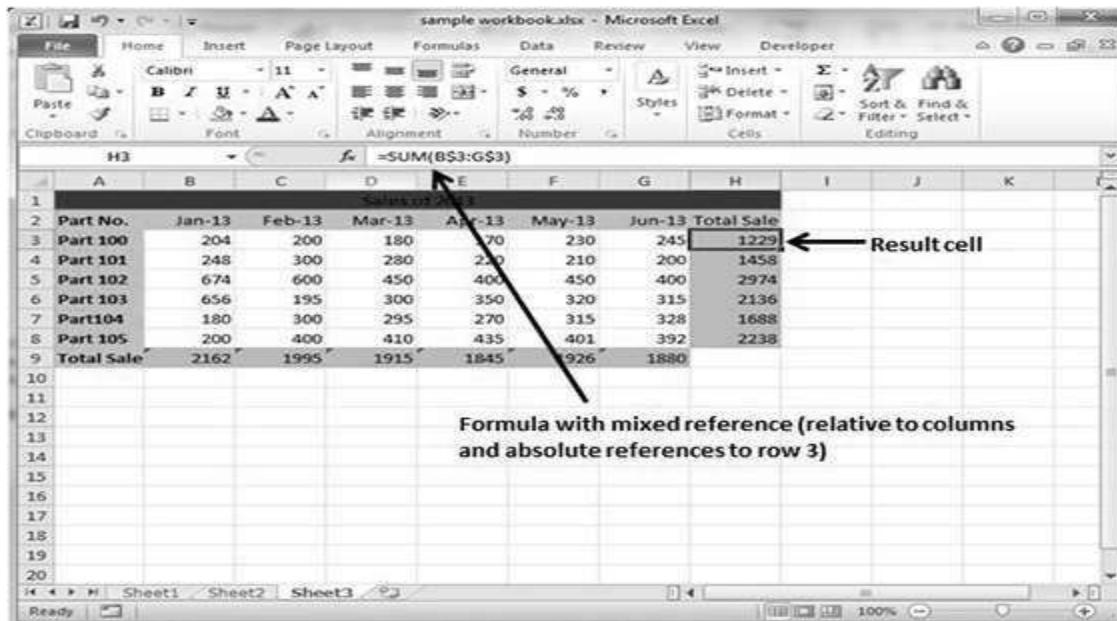

The row and column references do not change when you copy the formula because the reference is to an actual cell address. An absolute reference uses two dollar signs in its address: one for the column letter and one for the row number (for example, \$A\$5).

The screenshot shows a Microsoft Excel 2010 spreadsheet window. The formula bar at the top displays the formula $=\$D\$2+\$D\3 . The cell D4 contains the value 1380. A double-headed arrow connects the formula bar and the cell D4. A callout box points to the cell D4 with the text "Result cell where formula is written". Another callout box points to the formula bar with the text "Formula absolute references to cell \$D\$2 and \$D\$3".

A	B	C	D	E	F	
1	OrderID	Customer Lastname	Color	Quantity	Price	Total Amount
2	1	Cagle	Green/Navy	3	100	300
3	2	Cantwell	Green/Navy	18	60	1080
4	Total			21	160	1380

Mixed Cell References

Both the row or column reference is relative and the other is absolute. Only one of the address parts is absolute (for example, \$A5 or A\$5).

Functions in Formula

Many formulas you create use available worksheet functions. These functions enable you to greatly enhance the power of your formulas and perform calculations that are difficult if you use only the operators. For example, you can use the LOG or SIN function to calculate the Logarithm or Sin ratio. You can't do this complicated calculation by using the mathematical operators alone.

Using Functions

When you type = sign and then type any alphabet you will see the searched functions as below.

The screenshot shows a Microsoft Excel 2010 window with a sample workbook. The formula bar at the top has the text '=M' entered. A dropdown menu is open, listing various functions starting with 'M', such as MAX, MAXA, MODE, MODE.TREND, MODURATION, MEDIAN, MID, MIN, MINA, MINUTE, MINVERSE, and MIRR. Below the formula bar, there is a table with data for parts 100 through 105, and a row for total sales. The cell C10 contains the formula '=M'. A callout arrow points from the text 'Typing M will show number of functions starting with M' to the dropdown menu.

Typing M will show number of functions starting with M

Suppose you need to determine the largest value in a range. A formula can't tell you the answer without using a function. We will use formula that uses the MAX function to return the largest value in the range B3:B8 as **=MAX(A1:D100)**.

The screenshot shows a Microsoft Excel 2010 window with a sales data table. The formula bar at the top displays the formula `=MAX(B3:B8)`. A cursor arrow points from the formula bar to the cell B10, which contains the value 674. The table has columns for Part No., Month (Jan-13 to Jun-13), and Total Sale. Row 10 highlights the maximum value in column B (674). Row 11 highlights the minimum value in column B (180).

	A	B	C	D	E	F	G	H	I	J

Another example of functions. Suppose you want to find if the cell of month is greater than 1900 then we can give Bonus to Sales representative. Then we can achieve it with writing formula with IF functions as `=IF(B9>1900,"Yes","No")`

The screenshot shows a Microsoft Excel 2010 window with the title "sample workbook.xlsx - Microsoft Excel". The ribbon menu is visible at the top. The active cell is B12, which contains the formula `=IF(B9>1900,"Yes","No")`. The worksheet displays a table titled "Sales of 2013" with data for various parts from January to June. Row 12 is labeled "Good/Bad" and contains two cells with the value "Yes".

Function Arguments

In the above examples, you may have noticed that all the functions used parentheses. The information inside the parentheses is the list of arguments.

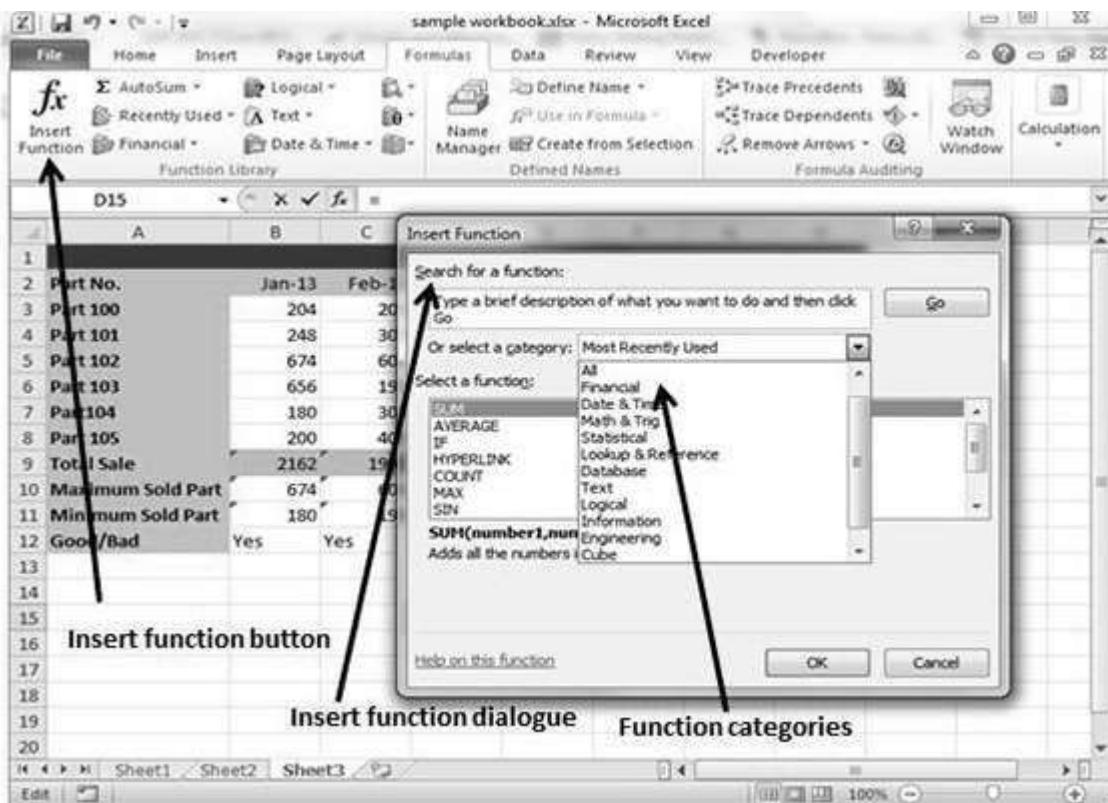

Functions vary in how they use arguments. Depending on what it has to do, a function may use.

- **No arguments:** Examples: Now(),Date(),etc.
- **One argument:** UPPER(),LOWER(),etc.
- **A fixed number of arguments:** IF(),MAX(),MIN(),AVERAGE(),etc.
- **Infinite number of arguments**
- **Optional arguments**

48 . BUILT IN FUNCTION

Built In Functions

MS Excel has many built in functions, which we can use in our formula. To see all the functions by category, choose **Formulas Tab** » **Insert Function**. Then Insert function Dialog appears from which we can choose the function.

Functions by Categories

Let us see some of the built in functions in MS Excel.

- **Text Functions**

- **LOWER:** Converts all characters in a supplied text string to lower case
- **UPPER:** Converts all characters in a supplied text string to upper case
- **TRIM:** Removes duplicate spaces, and spaces at the start and end of a text string.

- **CONCATENATE:** Joins together two or more text strings.
- **LEFT:** Returns a specified number of characters from the start of a supplied text string.
- **MID:** Returns a specified number of characters from the middle of a supplied text string.
- **RIGHT:** Returns a specified number of characters from the end of a supplied text string.
- **LEN:** Returns the length of a supplied text string.
- **FIND:** Returns the position of a supplied character or text string from within a supplied text string (case-sensitive).
- **Date & Time** ○ **DATE:** Returns a date, from a user-supplied year, month and day.
 - **TIME:** Returns a time, from a user-supplied hour, minute and second.
 - **DATEVALUE:** Converts a text string showing a date, to an integer that represents the date in Excel's date-time code.
 - **TIMEVALUE:** Converts a text string showing a time, to a decimal that represents the time in Excel.
 - **NOW:** Returns the current date & time.
 - **TODAY:** Returns today's date.
- **Statistical** ○ **MAX:** Returns the largest value from a list of supplied numbers. ○ **MIN:** Returns the smallest value from a list of supplied numbers. ○ **AVERAGE:** Returns the Average of a list of supplied numbers.
- **COUNT:** Returns the number of numerical values in a supplied set of cells or values.
- **COUNTIF:** Returns the number of cells (of a supplied range), that satisfies a given criteria.
- **SUM:** Returns the sum of a supplied list of numbers.
- **Logical**

- **AND:** Tests a number of user-defined conditions and returns TRUE if ALL of the conditions evaluate to TRUE, or FALSE otherwise.
- **OR:** Tests a number of user-defined conditions and returns TRUE if ANY of the conditions evaluate to TRUE, or FALSE otherwise.

49. DATA FILTERING

- **NOT:** Returns a logical value that is the opposite of a user supplied logical value or expression i.e. returns FALSE if the supplied argument is TRUE and returns TRUE if the supplied argument is FALSE).
- **Math & Trig**
 - **ABS:** Returns the absolute value (i.e. the modulus) of a supplied number.
 - **SIGN:** Returns the sign (+1, -1 or 0) of a supplied number. ○ **SQRT:** Returns the positive square root of a given number.
 - **MOD:** Returns the remainder from a division between two supplied numbers.

Filters in MS Excel

Filtering data in MS Excel refers to displaying only the rows that meet certain conditions. (The other rows gets hidden.)

Using the store data, if you are interested in seeing data where Shoe Size is 36, then you can set filter to do this. Follow the below mentioned steps to do this.

- Place a cursor on the Header Row.
- Choose **Data Tab** » **Filter** to set filter.

Click here to apply filter

(Select All)

Check or uncheck this to set different conditions

store	sku	config_attribute	type	attribute	model	color	shoe_size	UPC	category
admin	350BRK36LTR13FAL		simple	s				847520050616

admin	356TUP36LTR13FAL		simple	s				847520050814	

- Click the drop-down arrow in the Area Row Header and remove the check mark from Select All, which unselects everything.
- Then select the check mark for Size 36, which will filter the data and displays data of Shoe Size 36.
- Some of the row numbers are missing; these rows contain the filtered (hidden) data.
- There is drop-down arrow in the Area column now shows a different graphic — an icon that indicates the column is filtered.

sample workbook.xlsx - Microsoft Excel

The screenshot shows a Microsoft Excel spreadsheet titled "sample workbook.xlsx". The data is filtered to show only rows where the "shoe_size" column contains the value 36. The first row (header) is row 1, and the last visible row is row 38. Row 14 is highlighted with a red arrow pointing to it from below, and the text "Remaining rows gets hidden" is displayed below the table. A black arrow points from the text "Filter set for shoe size 36" to the filter icon in the Data tab ribbon.

store	sku	config_attribute	type	attribute_s	model	color	shoe_size	UPC	category
admin	350BRK36LTR13FAL		simple	shoe	350	Brick	36	847520050616	
admin	350CFE36LTR13FAL		simple	shoe	350	Coffee	36	847520050685

Using Multiple Filters

You can filter the records by multiple conditions i.e. by multiple column values. Suppose after size 36 is filtered, you need to have the filter where color is equal to Coffee. After setting filter for Shoe Size, choose Color column and then set filter for color.

sample workbook.xlsx - Microsoft Excel

The screenshot shows a Microsoft Excel spreadsheet titled "sample workbook.xlsx". The data is filtered to show only rows where the "shoe_size" column contains the value 36 and the "color" column contains the value "Coffee". The first row (header) is row 1, and the last visible row is row 38. Row 14 is highlighted with a red arrow pointing to it from below, and the text "Filtered Records" is displayed below the table. A black arrow points from the text "Filter set on Color" to the filter icon in the Data tab ribbon.

50. DATA SORTING

Sorting in MS Excel

Sorting data in MS Excel rearranges the rows based on the contents of a particular column. You may want to sort a table to put names in alphabetical order. Or, maybe you want to sort data by Amount from smallest to largest or largest to smallest.

To Sort the data follow the steps mentioned below.

- Select the Column by which you want to sort data.
- Choose Data Tab > Sort Below dialog appears.

- If you want to sort data based on a selected column, Choose **Continue with the selection** or if you want sorting based on other columns, choose **Expand Selection**.
- You can Sort based on the below Conditions.
 - **Values:** Alphabetically or numerically.
 - **Cell Color:** Based on Color of Cell.
 - **Font Color:** Based on Font color.
 - **Cell Icon:** Based on Cell Icon.

The screenshot shows a Microsoft Excel window titled "sample workbook.xlsx - Microsoft Excel". The Data tab is selected in the ribbon. A data table is visible in the background with columns: OrderID, Customer Lastname, Color, Quantity, Price, and Total Amount. A row from the table is selected, showing "Cagle" in the Customer Lastname column. A "Sort" dialog box is overlaid on the screen. The dialog box has a title bar "Sort" and a checkbox "My data has headers" which is checked. It contains three main sections: "Add Level" (with "Column" and "Sort by" dropdown set to "Customer Lastname"), "Sort On" (dropdown set to "Values"), and "Order" (dropdown set to "A to Z"). Arrows point from the text "Sort Dialogue" to the "Sort" button in the dialog box, and from the text "Column to sort by" to the "Sort by" dropdown in the dialog box.

OrderID	Customer Lastname	Color	Quantity	Price	Total Amount
1	Cagle	Green/Navy	3	100	300
2	Ca	Sort			
3	Sh				
4	Lu				
5	Re				
6	Ke				
7	Mi				
8	Za				
9	Za				
10	Mi				
11	Rif				
12	Rif				
13	Rif

51. USING RANGES

Ranges in MS Excel

A cell is a single element in a worksheet that can hold a value, some text, or a formula. A cell is identified by its address, which consists of its column letter and row number. For example, cell B1 is the cell in the second column and the first row.

A group of cells is called a range. You designate a range address by specifying its upper-left cell address and its lower-right cell address, separated by a colon

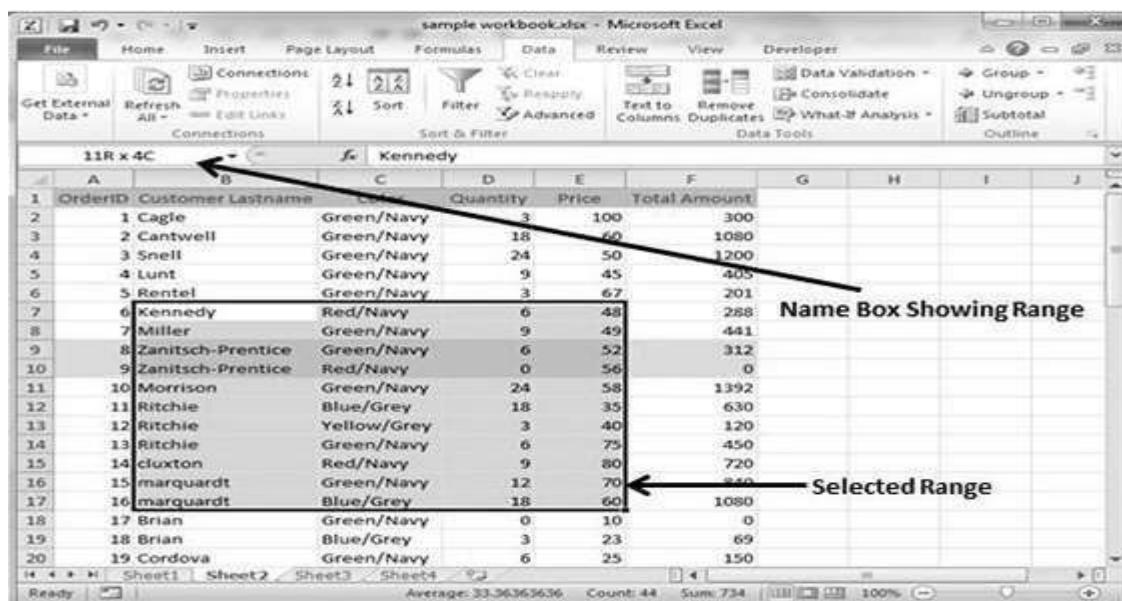

Example of Ranges:

- **C24:** A range that consists of a single cell.
- **A1:B1:** Two cells that occupy one row and two columns.
- **A1:A100:** 100 cells in column A.
- **A1:D4:** 16 cells (four rows by four columns).

Selecting Ranges

You can select a range in several ways:

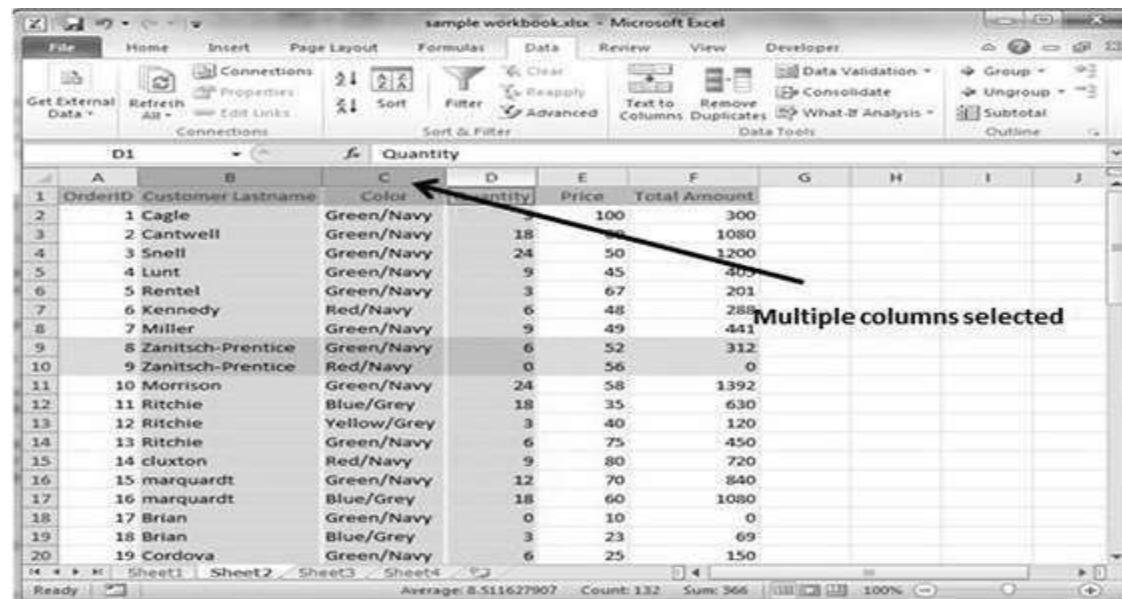

- Press the left mouse button and drag, highlighting the range. Then release the mouse button. If you drag to the end of the screen, the worksheet will scroll.
- Press the Shift key while you use the navigation keys to select a range.
- Press F8 and then move the cell pointer with the navigation keys to highlight the range. Press F8 again to return the navigation keys to normal movement.
- Type the cell or range address into the Name box and press Enter. Excel selects the cell or range that you specified.

Selecting Complete Rows and Columns

When you need to select an entire row or column. You can select entire rows and columns in much the same manner as you select ranges:

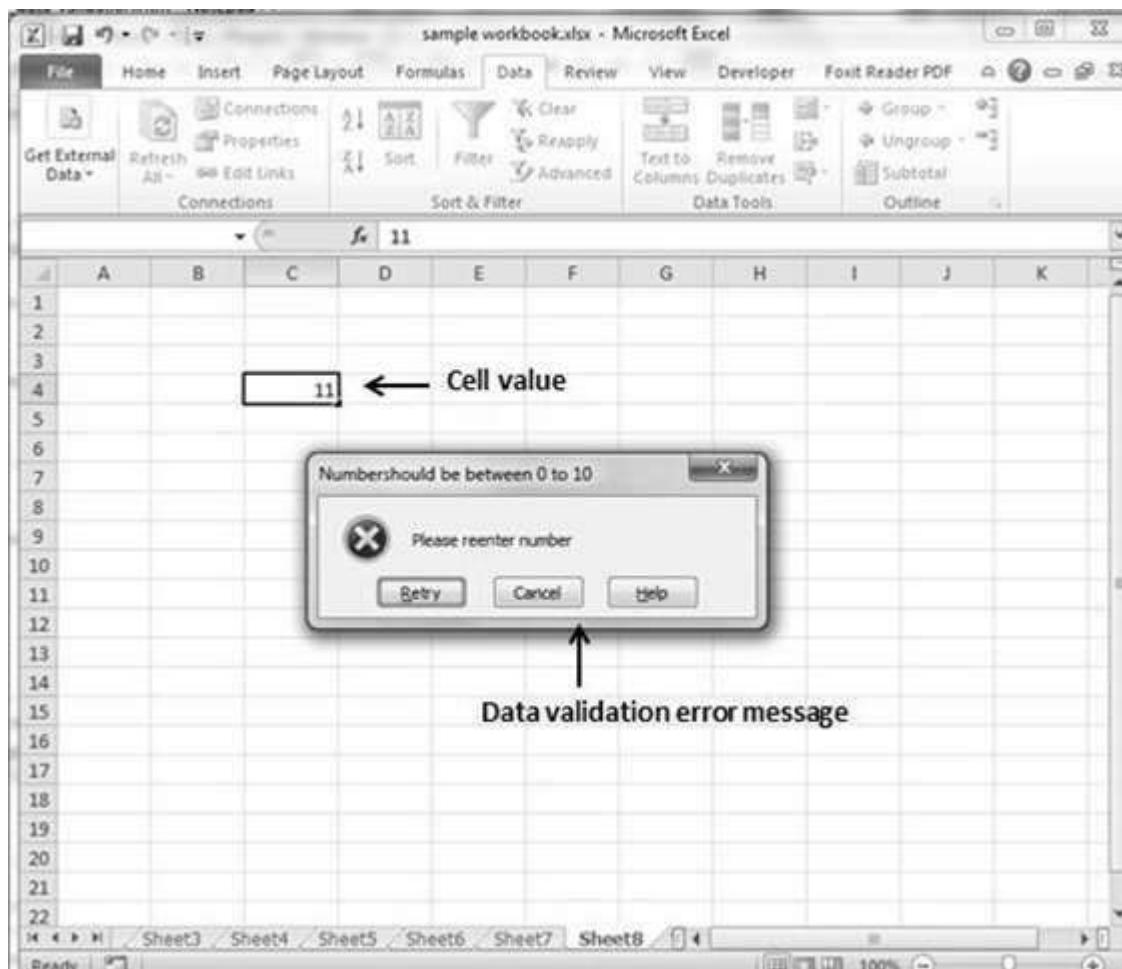

- Click the row or column border to select a single row or column.
- To select multiple adjacent rows or columns, click a row or column border and drag to highlight additional rows or columns.
- To select multiple (nonadjacent) rows or columns, press Ctrl while you click the row or column borders that you want.

52. DATA VALIDATION

Data Validation

MS Excel data validation feature allows you to set up certain rules that dictate what can be entered into a cell. For example, you may want to limit data entry in a particular cell to whole numbers between 0 and 10. If the user makes an invalid entry, you can display a custom message as shown below.

Validation Criteria

To specify the type of data allowable in a cell or range, follow the steps below, which shows all the three tabs of the Data Validation dialog box.

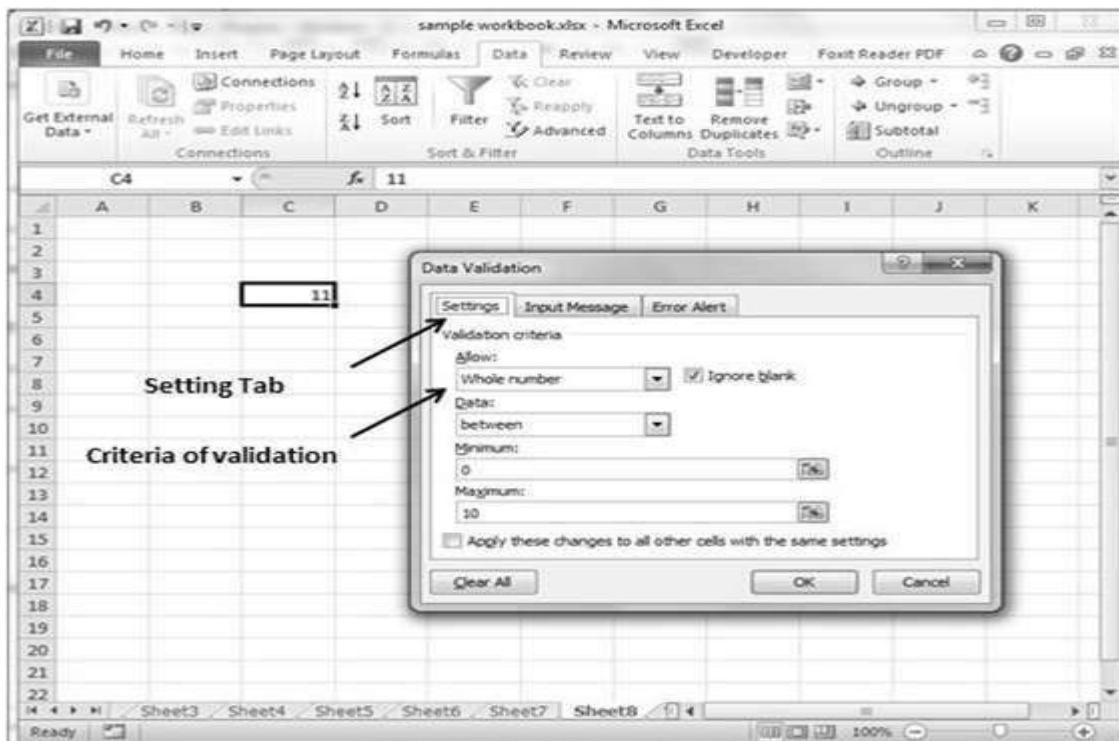

- Select the cell or range.

- Choose Data » Data Tools » Data Validation. Excel displays its Data Validation dialog box having 3 tabs settings, Input Message and Error alert.

Settings Tab

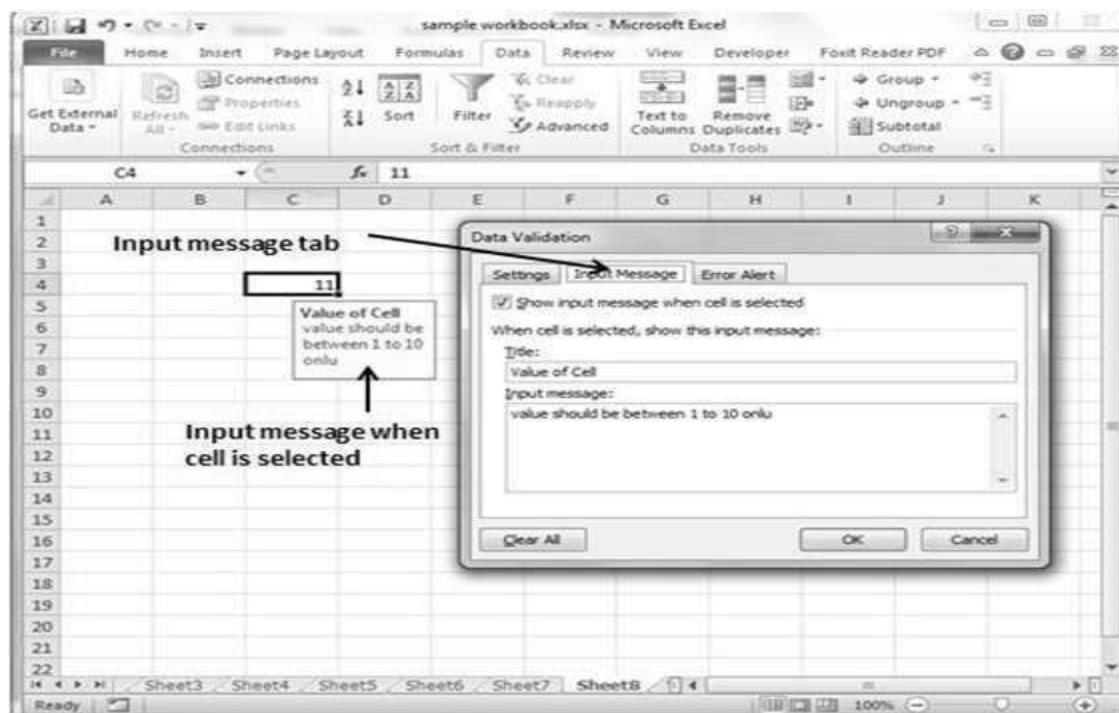

Here you can set the type of validation you need. Choose an option from the Allow drop-down list. The contents of the Data Validation dialog box will change, displaying controls based on your choice.

- **Any Value:** Selecting this option removes any existing data validation.
- **Whole Number:** The user must enter a whole number. For example, you can specify that the entry must be a whole number greater than or equal to 50.
- **Decimal:** The user must enter a number. For example, you can specify that the entry must be greater than or equal to 10 and less than or equal to 20.
- **List:** The user must choose from a list of entries you provide. You will create drop-down list with this validation. You have to give input ranges then those values will appear in the drop-down.
- **Date:** The user must enter a date. You specify a valid date range from choices in the Data drop-down list. For example, you can specify that the entered data must be greater than or equal to January 1, 2013, and less than or equal to December 31, 2013.
- **Time:** The user must enter a time. You specify a valid time range from choices in the Data drop-down list. For example, you can specify that the entered data must be later than 12:00 p.m.
- **Text Length:** The length of the data (number of characters) is limited. You specify a valid length by using the Data drop-down list. For example, you can specify that the length of the entered data be 1 (a single alphanumeric character).
- **Custom:** To use this option, you must supply a logical formula that determines the validity of the user's entry (a logical formula returns either TRUE or FALSE).

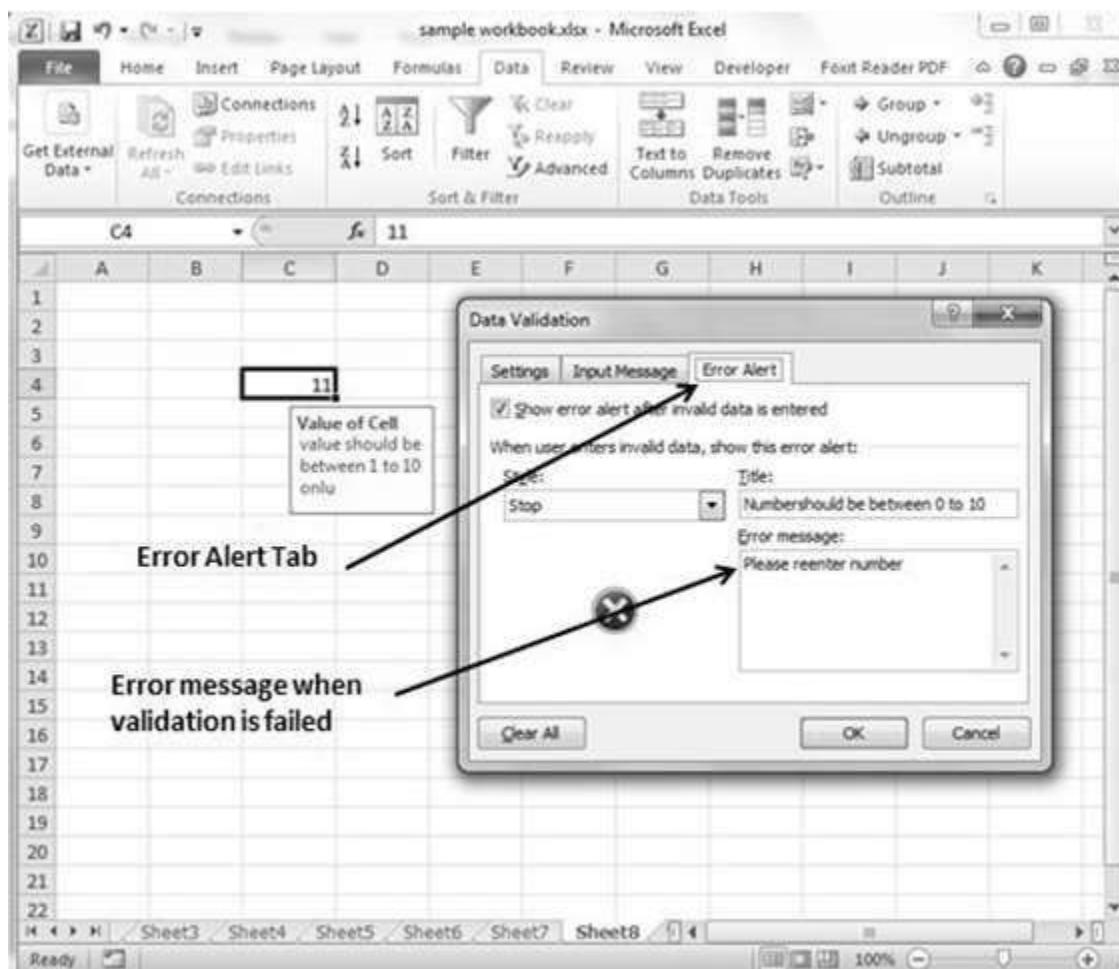

Input Message Tab

You can set the input help message with this tab. Fill the title and Input message of the Input message tab and the input message will appear when the cell is selected.

Error Alert Tab

You can specify an error message with this tab. Fill the title and error message. Select the style of the error as stop, warning or Information as per you need.

53. USING STYLES

Using Styles in MS Excel

With MS Excel 2010 **Named styles** make it very easy to apply a set of predefined formatting options to a cell or range. It saves time as well as makes sure that look of the cells are consistent.

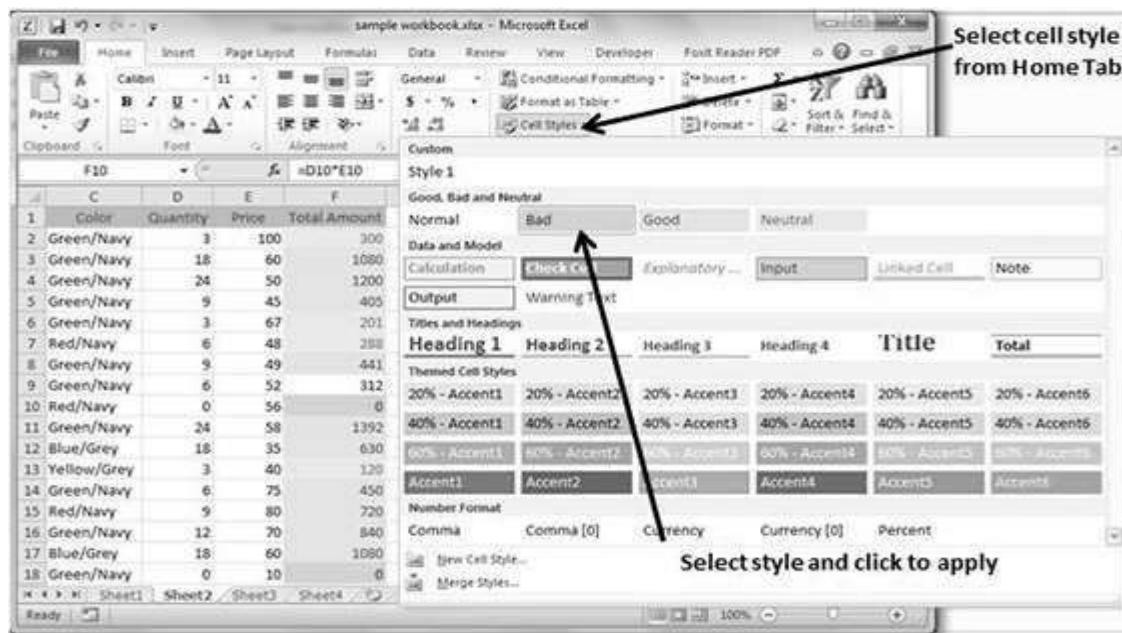

A Style can consist of settings for up to six different attributes:

- Number format
- Font (type, size, and color)
- Alignment (vertical and horizontal)
- Borders
- Pattern
- Protection (locked and hidden)

Now, let us see how styles are helpful. Suppose that you apply a particular style to some twenty cells scattered throughout your worksheet. Later, you realize that these cells should have a font size of 12 pt. rather than 14 pt. Rather than changing each cell, simply edit the style. All cells with that particular style change automatically.

Applying Styles

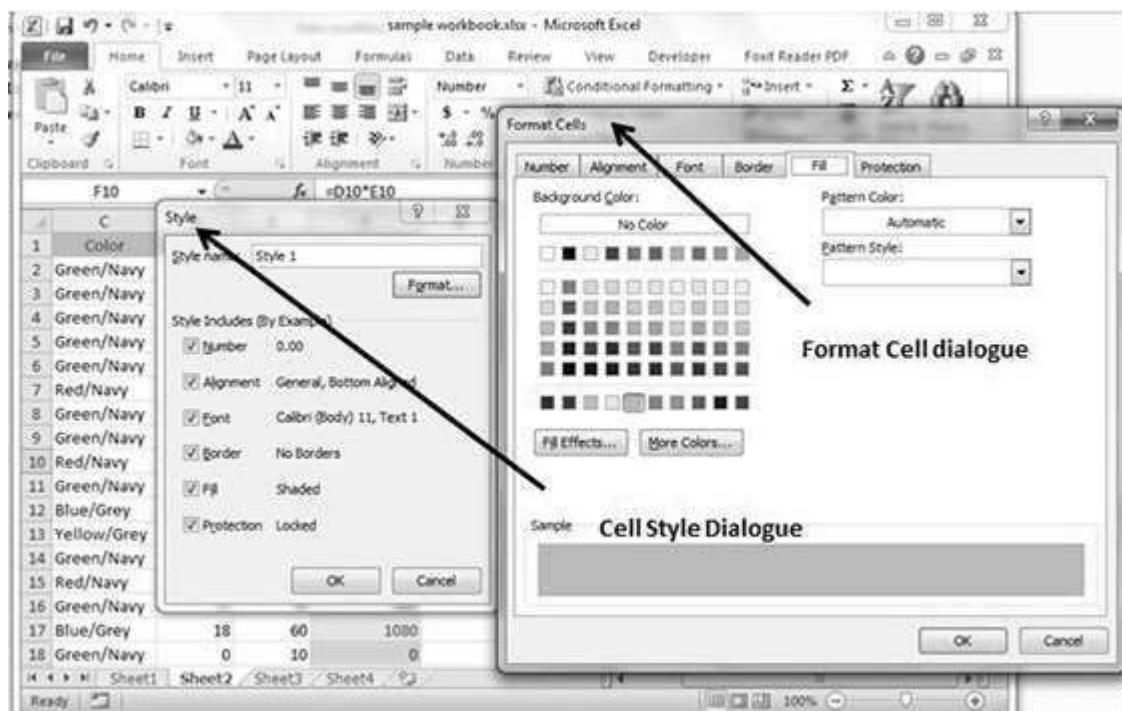

Choose **Home** » **Styles** » **Cell Styles**. Note that this display is a live preview, that is, as you move your mouse over the style choices, the selected cell or range temporarily displays the style. When you see a style you like, click it to apply the style to the selection.

Creating Custom Style in MS Excel

We can create new custom style in Excel 2010. To create a new style, follow these steps:

- Select a cell and click on Cell styles from Home Tab.
- Click on New Cell Style and give style name.
- Click on Format to apply formatting to the cell.

- After applying formatting click on OK. This will add new style in the styles. You can view it on **Home > Styles**.

54. USING THEMES

Using Themes in MS Excel

To help users create more professional-looking documents, MS Excel has incorporated a concept known as document themes. By using themes, it is easy to specify the colors, fonts, and a variety of graphic effects in a document. And best of all, changing the entire look of your document is a breeze. A few mouse clicks is all it takes to apply a different theme and change the look of your workbook.

Applying Themes

Choose **Page layout Tab** » **Themes Dropdown**. Note that this display is a live preview, that is, as you move your mouse over the Theme, it temporarily displays the theme effect. When you see a style you like, click it to apply the style to the selection.

Creating Custom Theme in MS Excel

We can create new custom Theme in Excel 2010. To create a new style, follow these steps:

- Click on the **save current theme option** under Theme in Page Layout Tab.
- This will save the current theme to office folder.
- You can browse the theme later to load the theme.

55. USING TEMPLATES

Using Templates in MS Excel

Template is essentially a model that serves as the basis for something. An Excel template is a workbook that's used to create other workbooks.

Viewing Available Templates

To view the Excel templates, choose **File > New** to display the available templates screen in Backstage View. You can select a template stored on your hard drive, or a template from Microsoft Office Online. If you choose a template from Microsoft Office Online, you must be connected to the Internet to download it. The Office Online Templates section contains a number of icons, which represents various categories of templates. Click an icon, and you'll see the available templates. When you select a template thumbnail, you can see a preview in the right panel.

On-line Templates

These template data is available online at the Microsoft server. When you select the template and click on it, it will download the template data from Microsoft server and opens it as shown below.

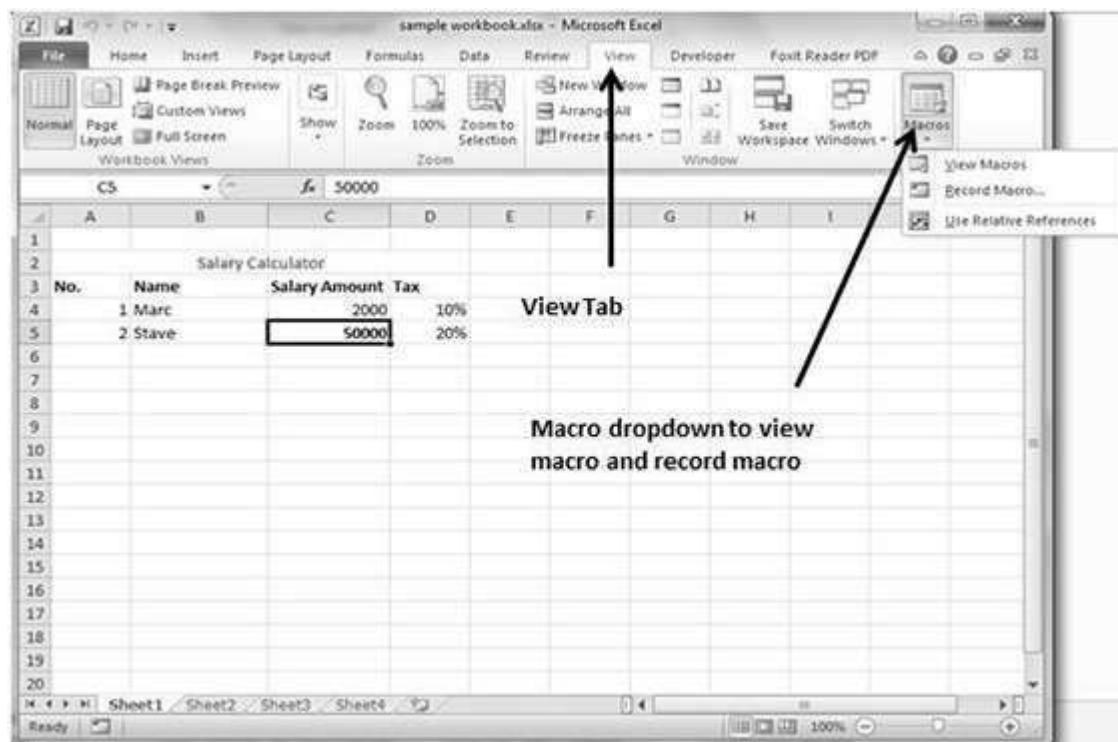

56. USING MACROS

Macros in MS Excel

Macros enable you to automate almost any task that you can undertake in Excel 2010. By using macro recorder from **View Tab** » **Macro Dropdown** to record tasks that you perform routinely, you not only speed up the procedure considerably but you are assured that each step in a task is carried out the same way each and every time you perform a task.

To view macros choose **View Tab** » **Macro dropdown**.

Macro Options

View tab contains a Macros command button to which a dropdown menu containing the following three options.

- **View Macros:** Opens the Macro dialog box where you can select a macro to run or edit.

- **Record Macro:** Opens the Record Macro dialog box where you define the settings for your new macro and then start the macro recorder; this is the same as clicking the Record Macro button on the Status bar.

Excel 2010

- **Use Relative References:** Uses relative cell addresses when recording a macro, making the macro more versatile by enabling you to run it in areas of a worksheet other than the ones originally used in the macro's recording.

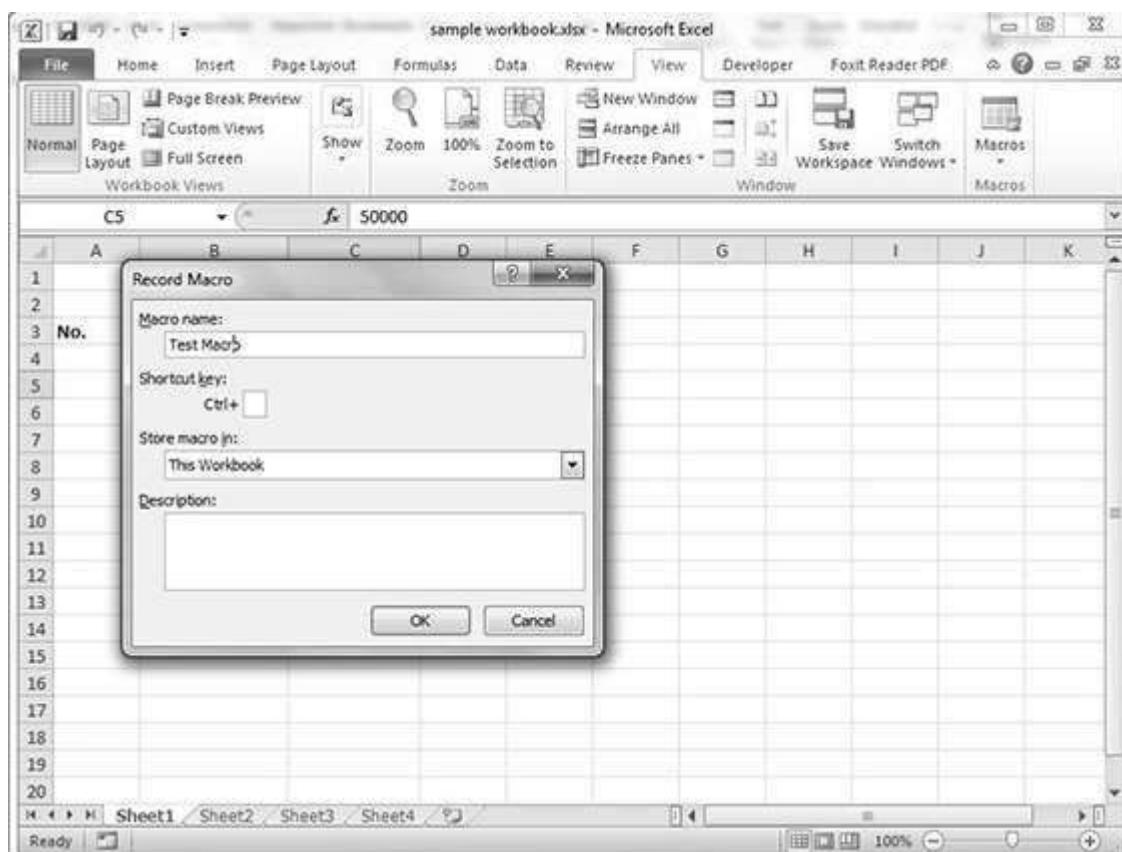

Creating Macros

You can create macros in one of two ways:

- Use MS Excel's macro recorder to record your actions as you undertake them in a worksheet.
- Enter the instructions that you want to be followed in a VBA code in the Visual Basic Editor.

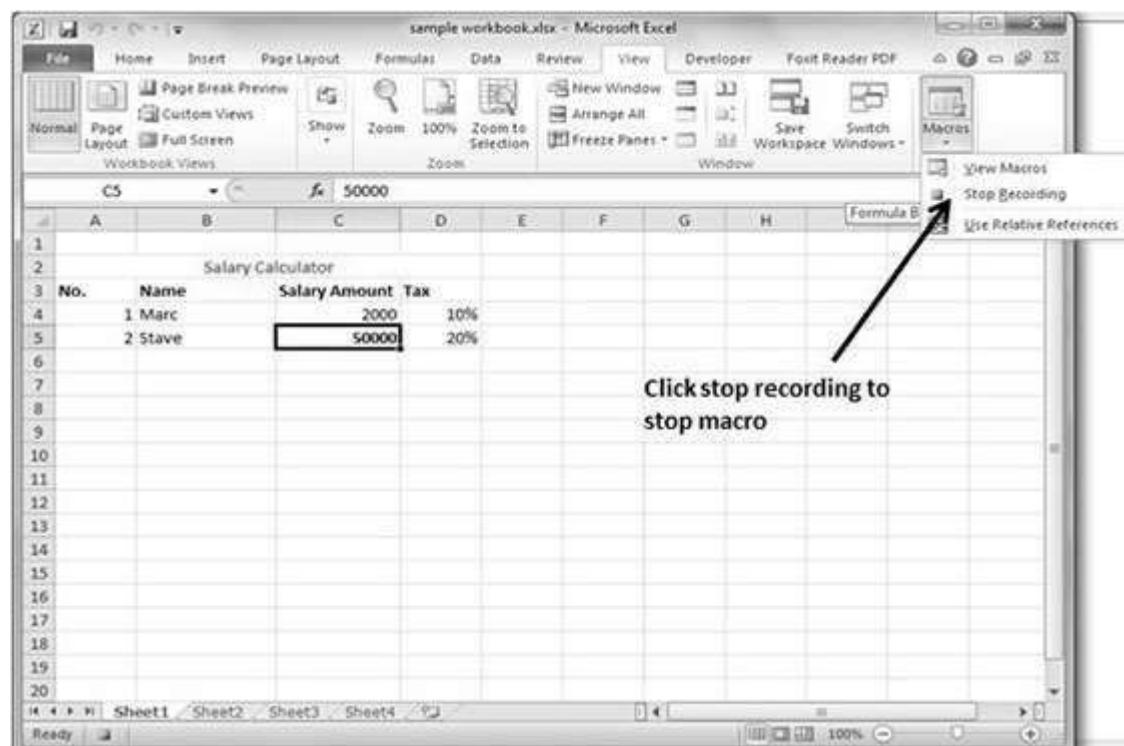

Now let's create a simple macro that will automate the task of making cell content Bold and apply cell color.

- Choose View Tab > Macro dropdown.
- Click on Record Macro as below.

- Now Macro recording will start.
- Do the steps of action, which you want to perform repeatedly. Macro will record those steps.

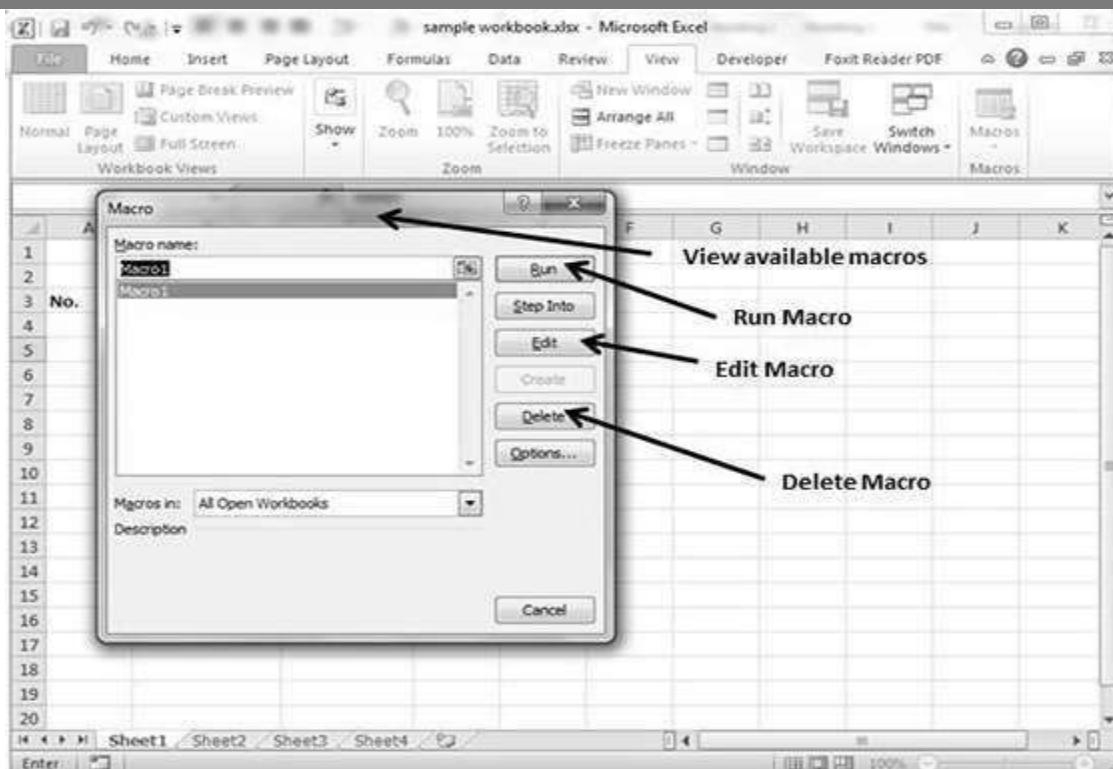

- You can stop the macro recording once done with all steps.

Edit Macro

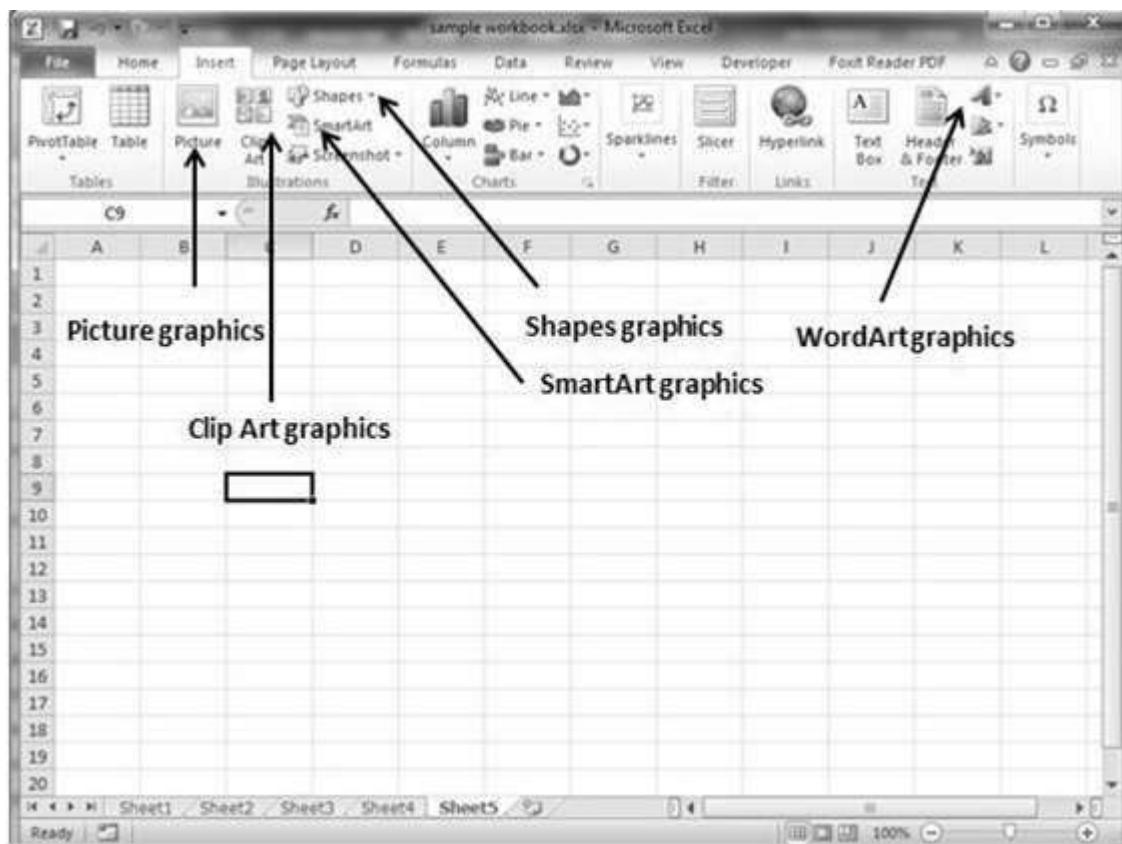

You can edit the created Macro at any time. Editing macro will take you to the VBA programming editor.

57. ADDING GRAPHICS

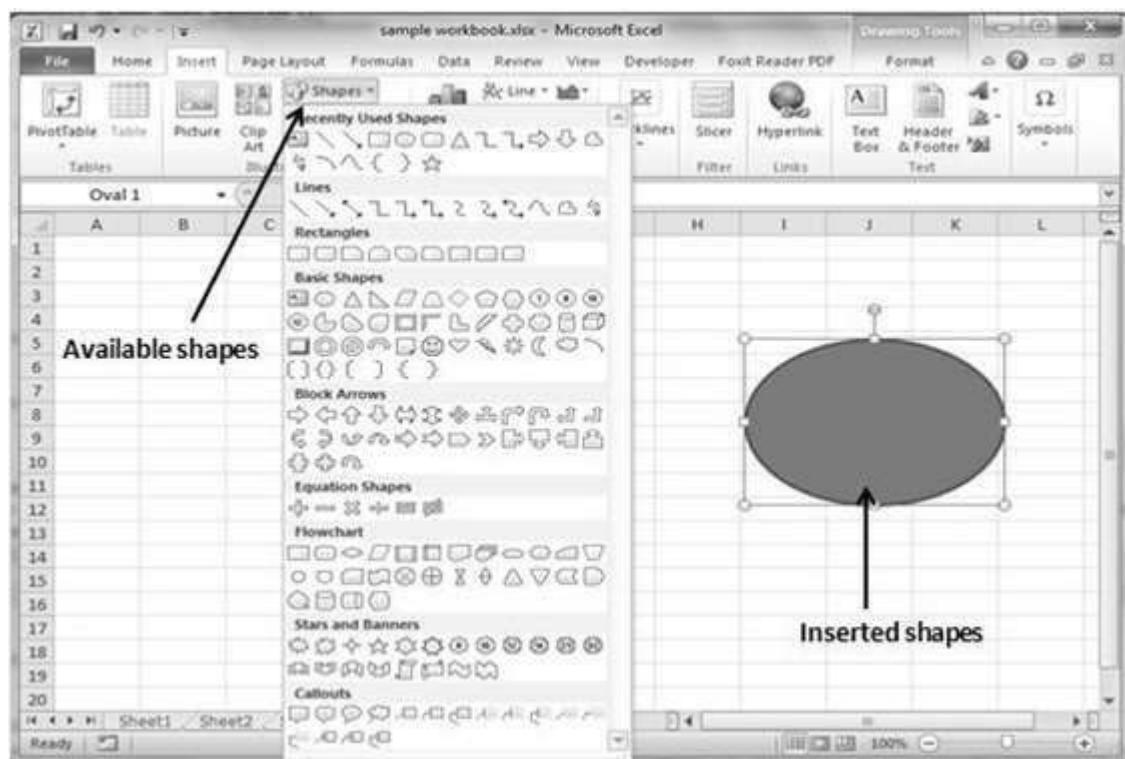

Graphic Objects in MS Excel

MS Excel supports various types of graphic objects like Shapes gallery, SmartArt, Text Box, and WordArt available on the Insert tab of the Ribbon. Graphics are available in the **Insert Tab**. See the screenshots below for various available graphics in MS Excel 2010.

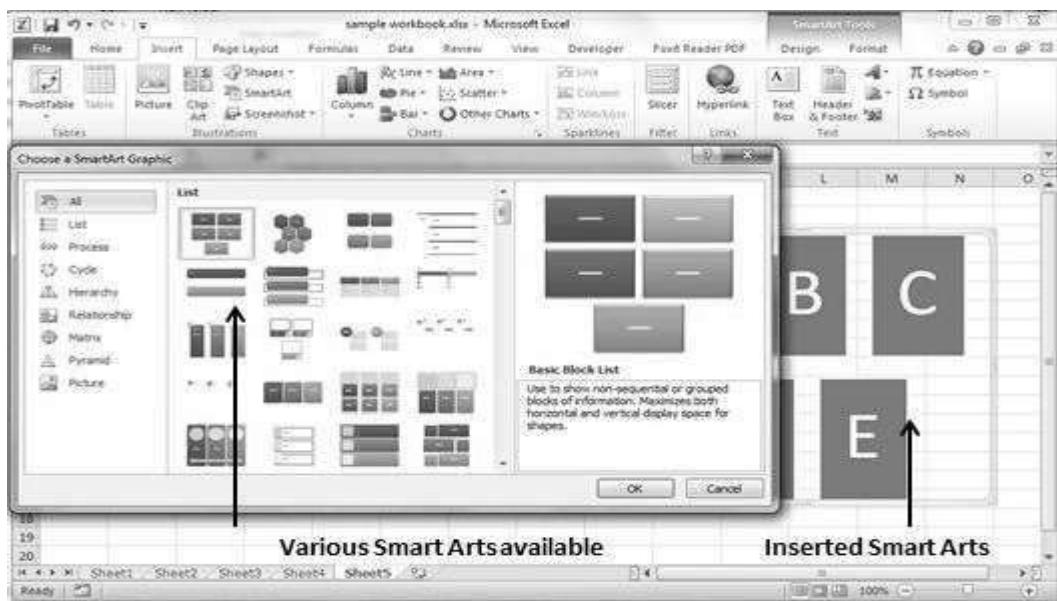

Insert Shape

- Choose Insert Tab » Shapes dropdown.
- Select the shape you want to insert. Click on shape to insert it.
- To edit the inserted shape just drag the shape with the mouse. Shape will adjust the shape.

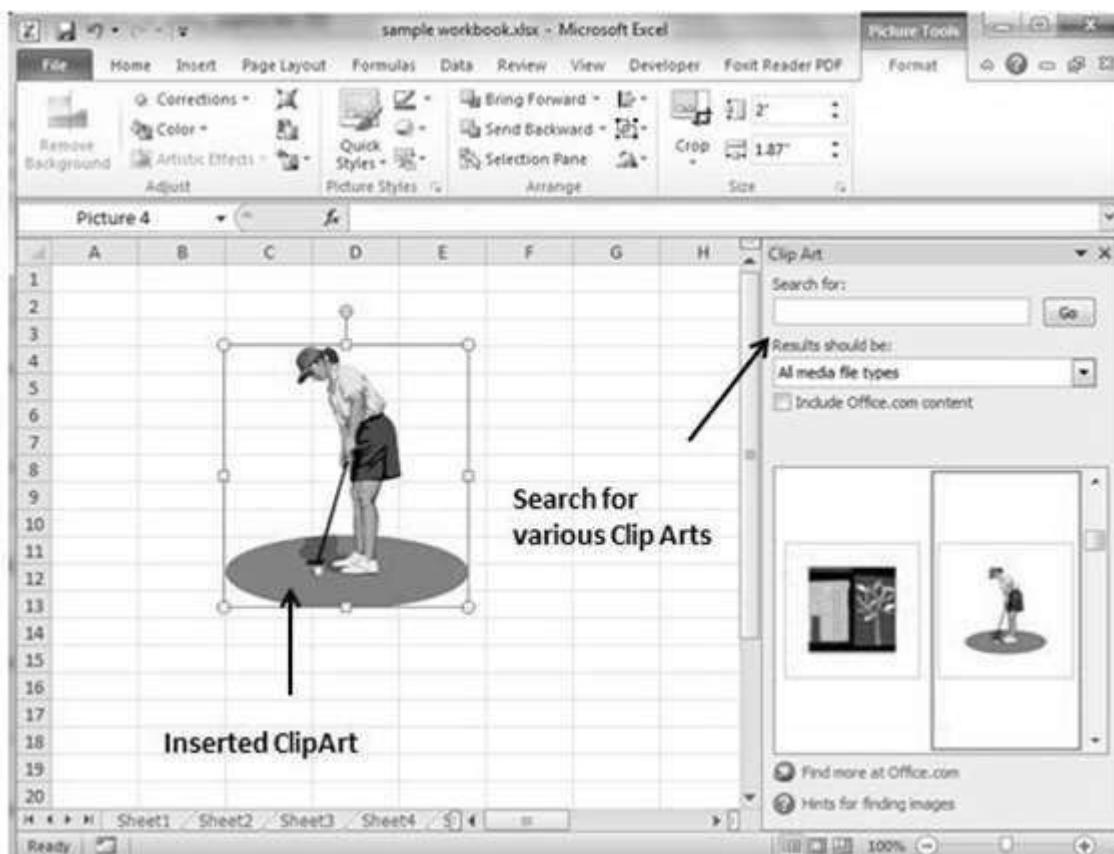

Insert Smart Art

- Choose Insert Tab » SmartArt.
- Clicking SmartArt will open the SmartArt dialogue as shown below in the screen-shot. Choose from the list of available smartArts.
- Click on SmartArt to Insert it in the worksheet.
- Edit the SmartArt as per your need.

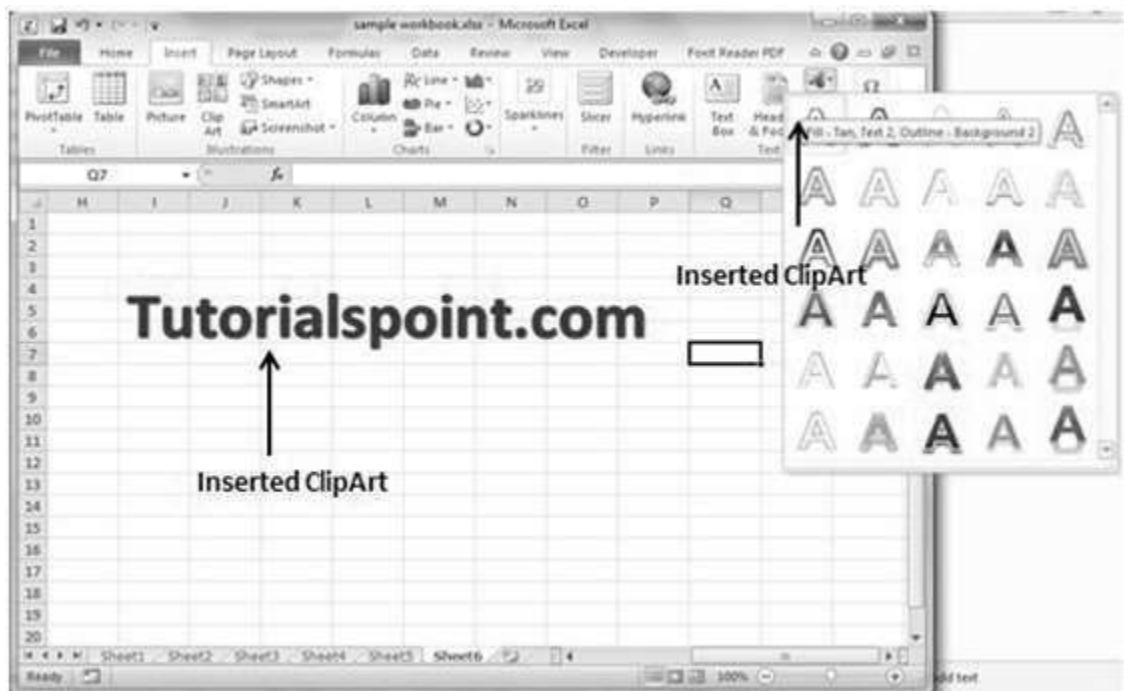

Insert Clip Art

- Choose Insert Tab » Clip Art.
- Clicking Clip Art will open the search box as shown in the below screenshot. Choose from the list of available Clip Arts.
- Click on Clip Art to Insert it in the worksheet.

Insert Word Art

- Choose Insert Tab » WordArt.
- Select the style of WordArt, which you like and click it to enter a text in it.

58. CROSS REFERENCING

Graphic Objects in MS Excel

When you have information spread across several different spreadsheets, it can seem a daunting task to bring all these different sets of data together into one meaningful list or table. This is where the Vlookup function comes into its own.

VLOOKUP

VlookUp searches for a value vertically down for the lookup table. VLOOKUP(lookup_value,table_array,col_index_num,range_lookup) has 4 parameters as below.

- **lookup_value:** It is the user input. This is the value that the function uses to search on.
- **The table_array:** It is the area of cells in which the table is located. This includes not only the column being searched on, but the data columns for which you are going to get the values that you need.
- **Col_index_num:** It is the column of data that contains the answer that you want.
- **Range_lookup:** It is a TRUE or FALSE value. When set to TRUE, the lookup function gives the closest match to the lookup_value without going over the lookup_value. When set to FALSE, an exact match must be found to the lookup_value or the function will return #N/A. Note, this requires that the column containing the lookup_value be formatted in ascending order.

VLOOKUP Example

Let's look at a very simple example of cross-referencing two spreadsheets. Each spreadsheet contains information about the same group of people. The first spreadsheet has their dates of birth, and the second shows their favorite color. How do we build a list showing the person's name, their date of birth and their favorite color? VLOOOKUP will help in this case. First of all, let us see data in both the sheets.

This is data in the first sheet.

sample workbook.xlsx - Microsoft Excel

This screenshot shows the 'sample workbook.xlsx' file in Microsoft Excel. The 'Sheet1' tab is selected, displaying a table of person data from row 1 to 12. The columns are labeled Person ID, PersonName, and BirthDate. A red box highlights the cell containing '11 stash'. An arrow points from the text 'Data in the first sheet' to this highlighted cell.

Person ID	PersonName	BirthDate
1	Swapnil	18.11.1989
2	Cordova	08.02.1980
3	Livingston	18.07.1985
4	Andy	27.09.1984
5	Cordova	10.04.1988
6	Bowlby	03.01.1990
7	Mandel	02.10.1991
8	Mandel	12.10.1987
9	Cottrell	13.01.1986
10	Chickey	14.05.1986
11	stash	13.02.1984

This is data in the second sheet.

sample workbook.xlsx - Microsoft Excel

This screenshot shows the 'sample workbook.xlsx' file in Microsoft Excel. The 'Sheet2' tab is selected, displaying a table of person data from row 1 to 12. The columns are labeled Person ID, PersonName, and Color. A red box highlights the cell containing '11 Cordova'. An arrow points from the text 'Data in the second sheet' to this highlighted cell.

Person ID	PersonName	Color
1	Bowlby	Blue
2	Mandel	red
3	Mandel	green
4	Cottrell	black
5	Chickey	white
6	stash	orange
7	Swapnil	lime
8	Cordova	pink
9	Livingston	Blue
10	Cordova	orange

Now for finding the respective favorite color for that person from another sheet we need to vlookup the data. First argument to the VLOOKUP is lookup value (In this case it is person name). Second argument is the table array, which is table **Excel 2010**

in the second sheet from B2 to C11. Third argument to VLOOKUP is Column index num, which is the answer we are looking for. In this case, it is 2 the color column number is 2. The fourth argument is True returning partial match or false returning exact match. After applying VLOOKUP formula it will calculate the color and the results are displayed as below.

The screenshot shows a Microsoft Excel spreadsheet titled "sample workbook.xlsx - Microsoft Excel". The formula bar at the top displays the formula =VLOOKUP(B8,Sheet10!B2:C17,2,FALSE). The main area contains a table with columns: Person ID, Person Name, Birth Date, and Color. The table has 12 rows, labeled 1 through 12. Row 1 is a header. Row 4 (Andy) contains the value "#N/A" in the Color column, indicating that the value was not found in the lookup table. A callout bubble points to this cell with the text "N/A in case value not found in corresponding lookup value". Another callout bubble points to the table with the text "Data in the second sheet". The ribbon menu is visible at the top, and the status bar at the bottom shows "Ready" and "100%".

	Person ID	Person Name	Birth Date	Color
1				
2	1 Swapnil		18.11.1989	lime
3	2 Cordova		08.02.1980	pink
4	3 Livingston		18.07.1985	Blue
5	4 Andy		27.09.1984	#N/A
6	5 Cordova		10.04.1988	pink
7	6 Bowlby		03.01.1990	Blue
8	7 Mandel		02.10.1991	red
9	8 Mandel		12.10.1987	red
10	9 Cottrell		13.01.1986	black
11	10 Chickey		14.05.1986	white
12	11 stash		13.02.1984	orange

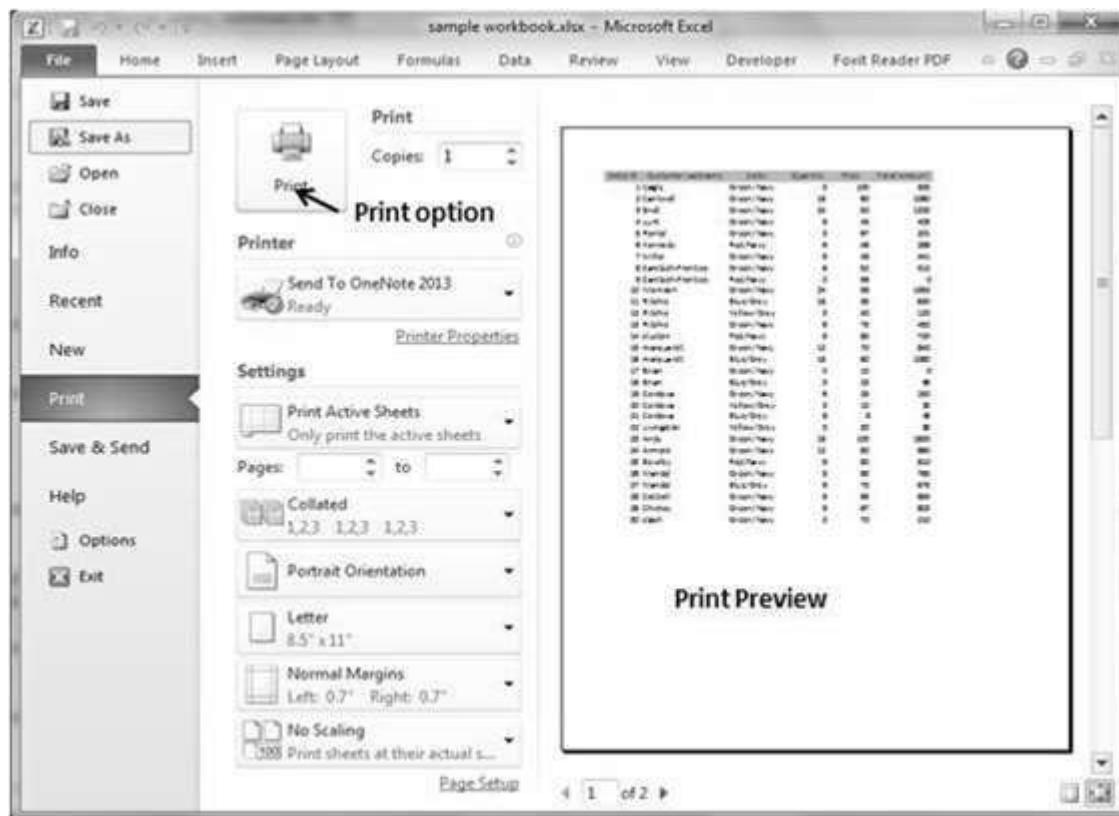

As you can see in the above screen-shot that results of VLOOKUP has searched for color in the second sheet table. It has returned #N/A in case where match is not found. In this case, Andy's data is not present in the second sheet so it returned #N/A.

59. PRINTING WORKSHEETS

Quick Print

If you want to print a copy of a worksheet with no layout adjustment, use the Quick Print option. There are two ways in which we can use this option.

- Choose **File > Print** (which displays the Print pane), and then click the Print button.
- Press **Ctrl+P** and then click the Print button (or press Enter).

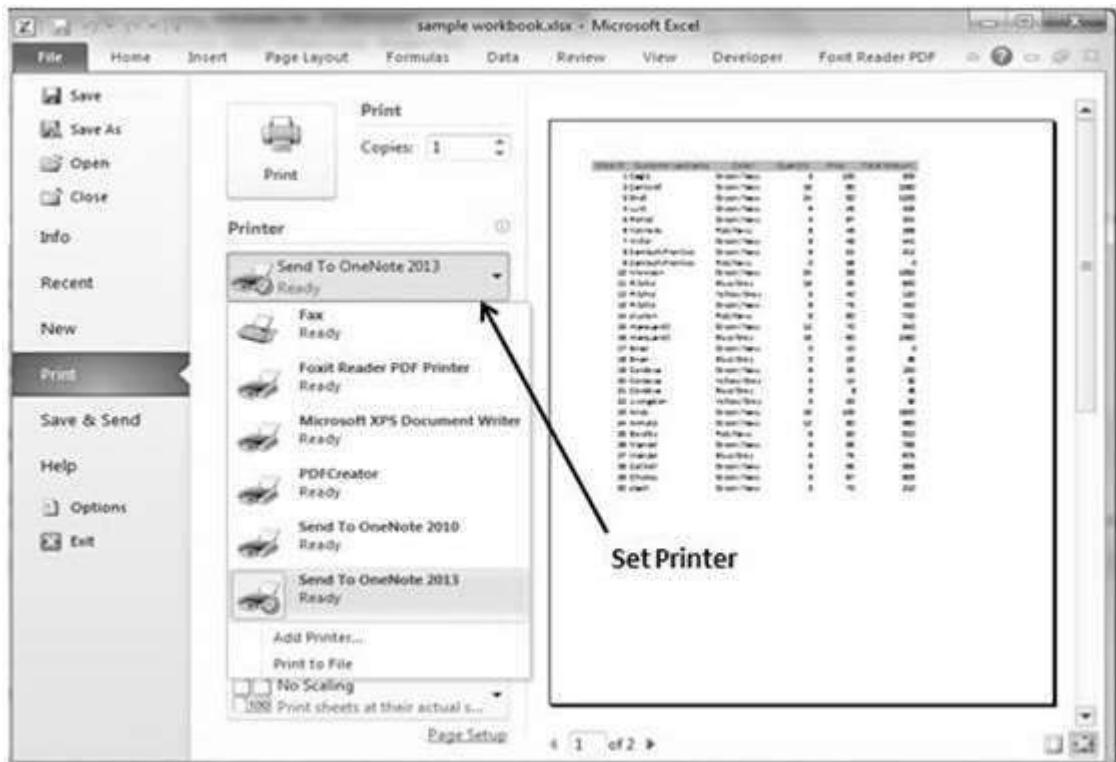

Adjusting Common Page Setup Settings

You can adjust the print settings available in the Page setup dialogue in different ways as discussed below. Page setup options include Page orientation, Page Size, Page Margins, etc.

- The Print screen in Backstage View, displayed when you choose **File > Print**.
- The **Page Layout tab** of the Ribbon.

Choosing Your Printer

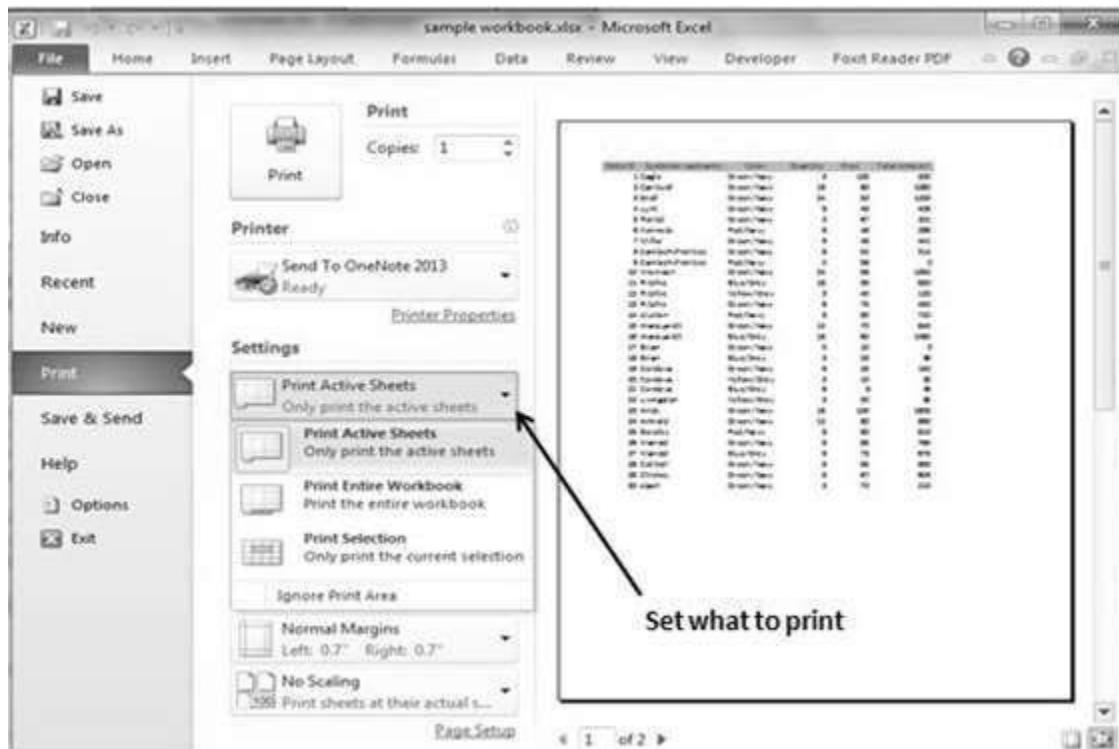

To switch to a different printer, choose **File** ➞ **Print** and use the drop-down control in the Printer section to select any other installed printer.

Specifying What You Want to Print

Sometimes you may want to print only a part of the worksheet rather than the entire active area. Choose **File** ➞ **Print** and use the controls in the Settings section to specify what to print.

- **Active Sheets:** Prints the active sheet or sheets that you selected.
- **Entire Workbook:** Prints the entire workbook, including chart sheets.
- **Selection:** Prints only the range that you selected before choosing **File** ➞ **Print**.

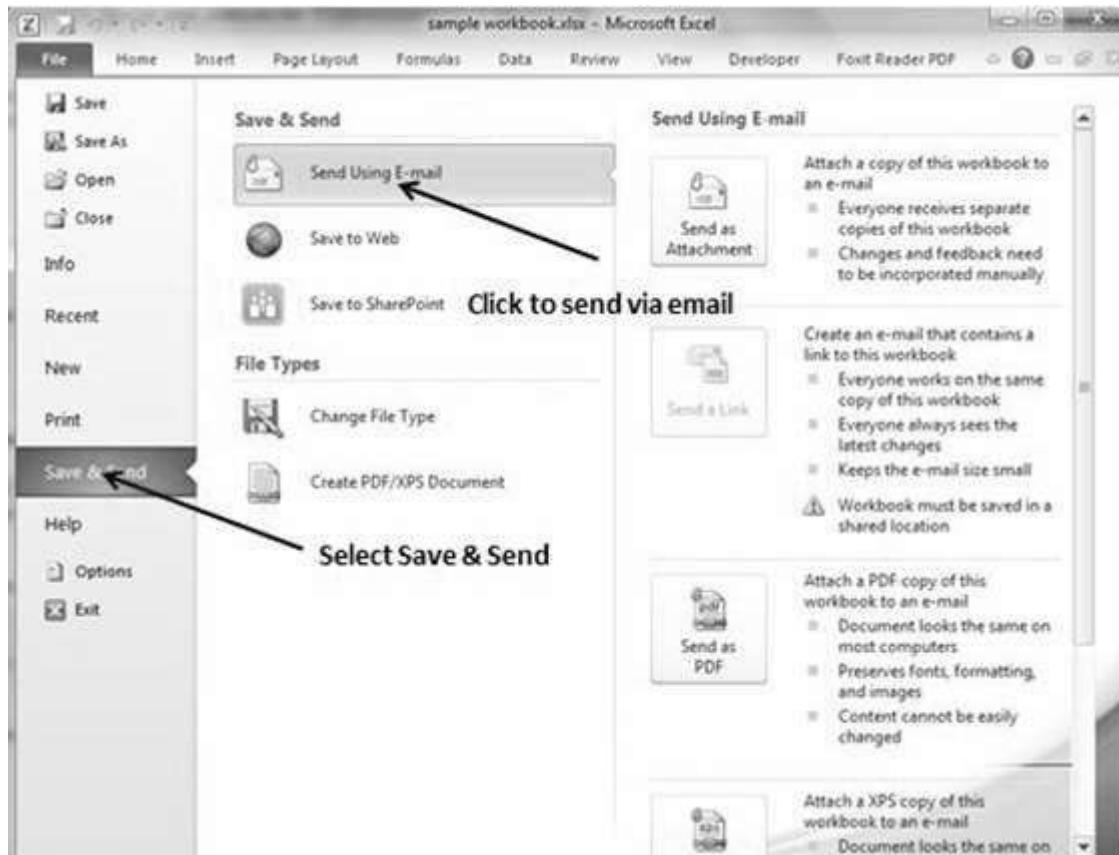

60. EMAIL WORKBOOKS

Email Workbook

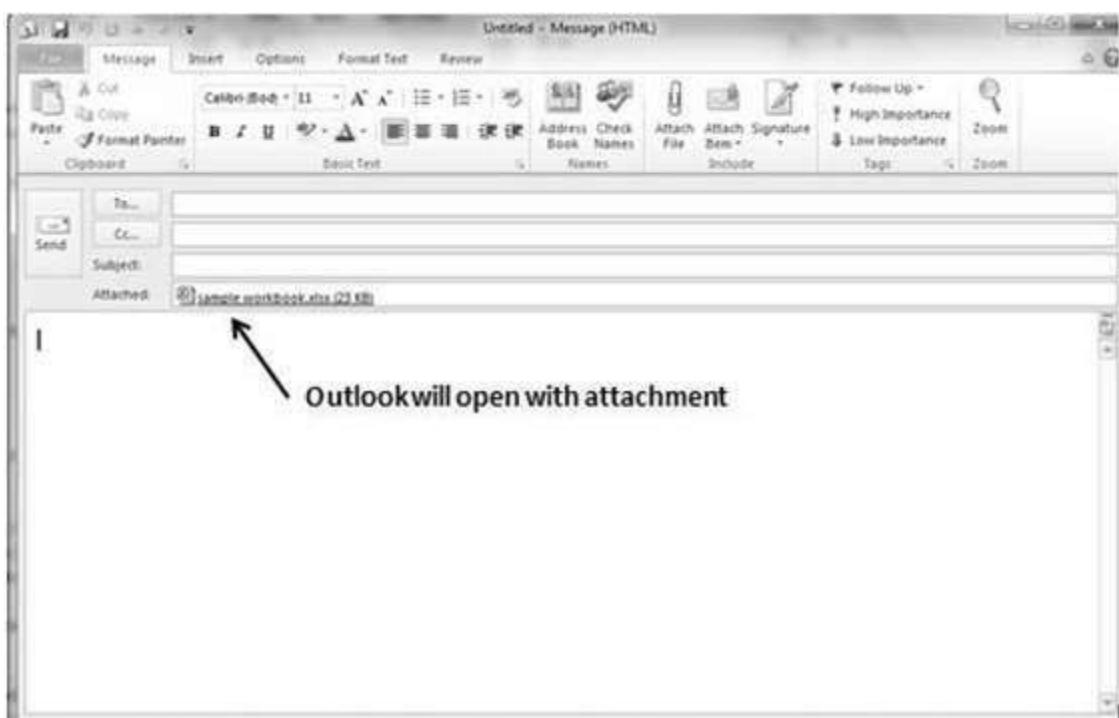

MS Excel allows you to email the workbook very easily. To email the workbook to anyone, follow the below mentioned steps.

- Choose **File > Save and Send**. It basically saves the document first and then the emails.

- Click on Send using E-mail if your email system is configured. MS Outlook will open with the file as attachment in the New Email Window. You can send mail this workbook to anyone with valid email address.

Excel 2010

Outlook will open with attachment

61. TRANSLATE WORKSHEET

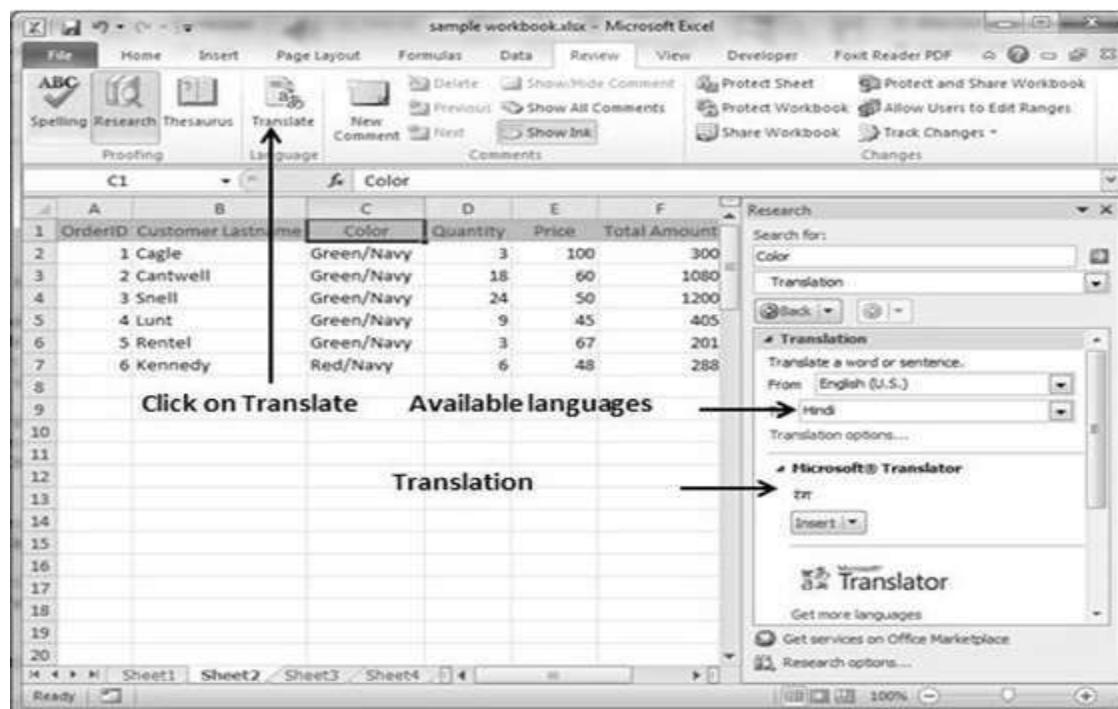

Translate Worksheet

You can translate the text written in a different language, such as phrases or paragraphs, individual words (by using the Mini Translator), or translate your whole file with MS Excel 2010.

Translation is available in the review tab of the ribbon in MS Excel 2010. You can quickly translate cell into different language with this option.

Performing Translation Step By Step

- Select the content, which you want to translate to a different language.
- Choose **review tab** >> **translation**.
- It will open the pane from which you can select the language to which you need to translate.
- You need to have an internet connection for performing translation. It will translate using the Microsoft Translator.
- Click on Insert to apply translation changes.

62. WORKBOOK SECURITY

Workbook Security

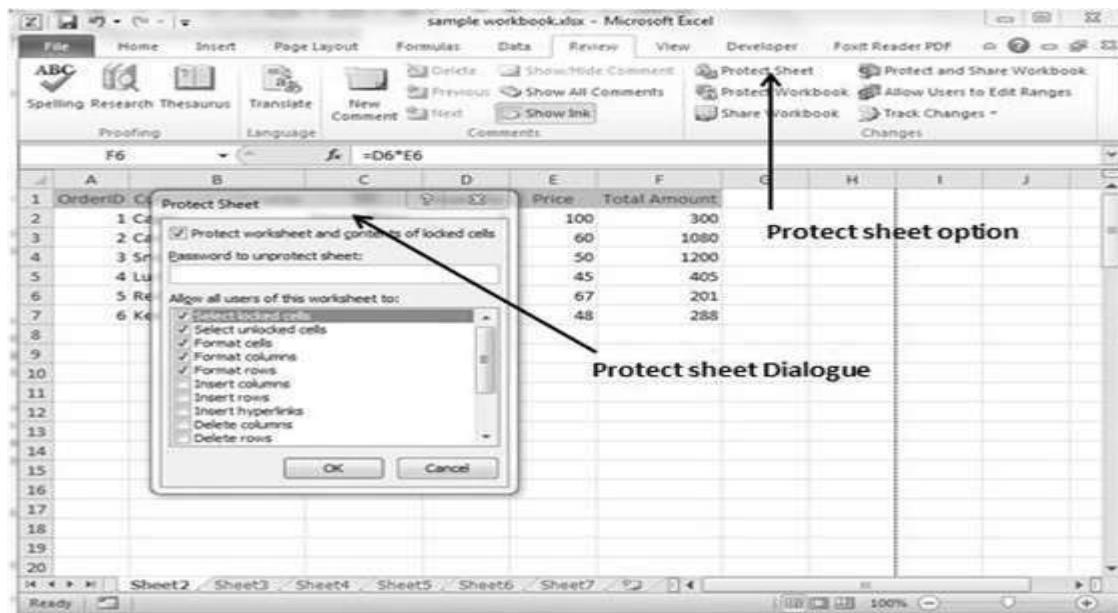

We can apply security to the workbook by the concept of protection available in the Review Tab of ribbon. MS Excel's protection-related features fall into three categories.

- **Worksheet protection:** Protecting a worksheet from being modified, or restricting the modifications to certain users.
- **Workbook protection:** Protecting a workbook from having sheets inserted or deleted, and also requiring the use of password to open the workbook.

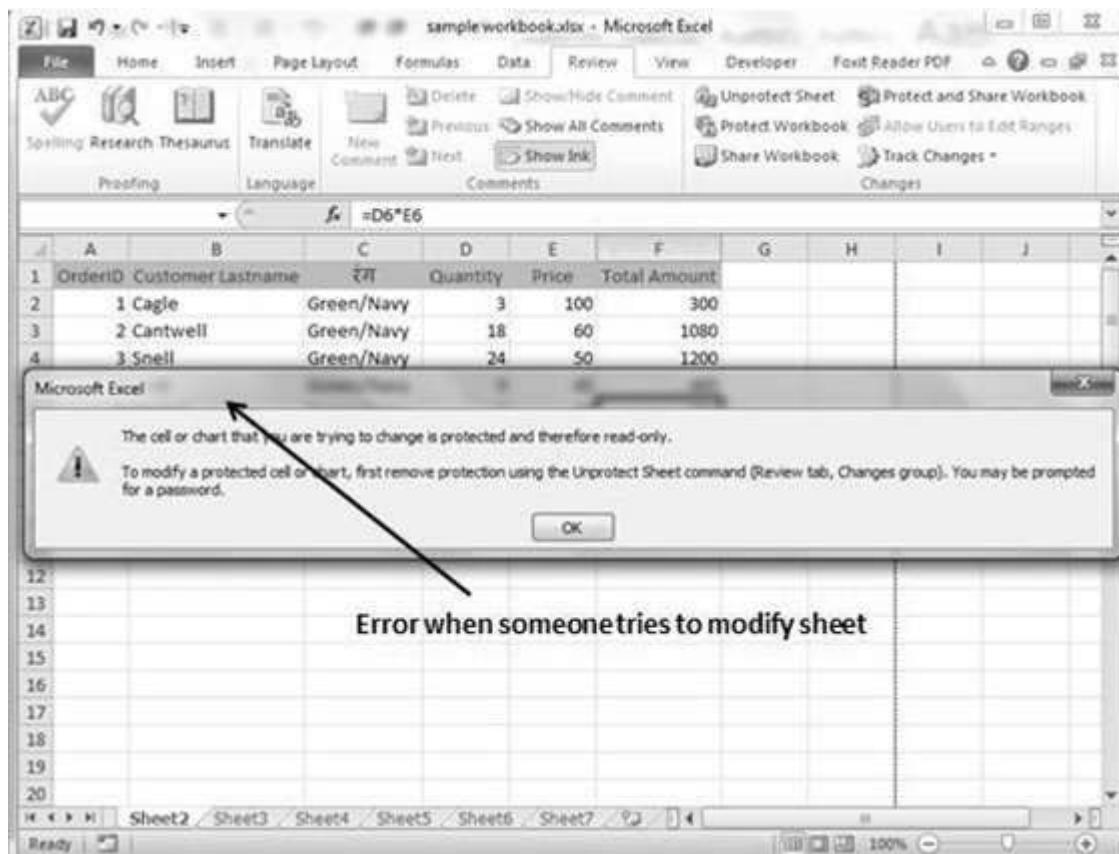

Protect Worksheet

You may want to protect a worksheet for a variety of reasons. One reason is to prevent yourself or others from accidentally deleting the formulas or other critical data. A common scenario is to protect a worksheet, so that the data can be changed, but the formulas can't be changed.

To protect a worksheet, choose **Review** ➯ **Changes group** ➯ **Protect Sheet**. Excel displays the Protect Sheet dialog box. Note that providing a password is optional. If you enter a password, that password will be required to unprotect the worksheet. You can select various options in which the sheet should be protected. Suppose we checked Format Cells option then Excel will not allow to format cells.

When somebody tries to format the cells, he or she will get the error as shown in the screenshot below.

To unprotect a protected sheet, choose **Review** » **Changes group** » **Unprotect Sheet**. If the sheet was protected with a password, you're prompted to enter that password.

Protecting a Workbook

Excel provides three ways to protect a workbook.

- Requires a password to open the workbook.
- Prevents the users from adding sheets, deleting sheets, hiding sheets, and unhiding sheets.
- Prevents users from changing the size or position of windows.

Requiring a Password to Open a Workbook

Excel lets you save a workbook with a password. After doing so, whoever tries to open the workbook, must enter the password. To add a password to a workbook, follow these steps.

- Choose **File** » **Info** » **Protect Workbook** » **Encrypt With Password**. Excel displays the Encrypt Document dialog box.
- Type a password and click OK.
- Type the password again and click OK.
- Save the workbook.

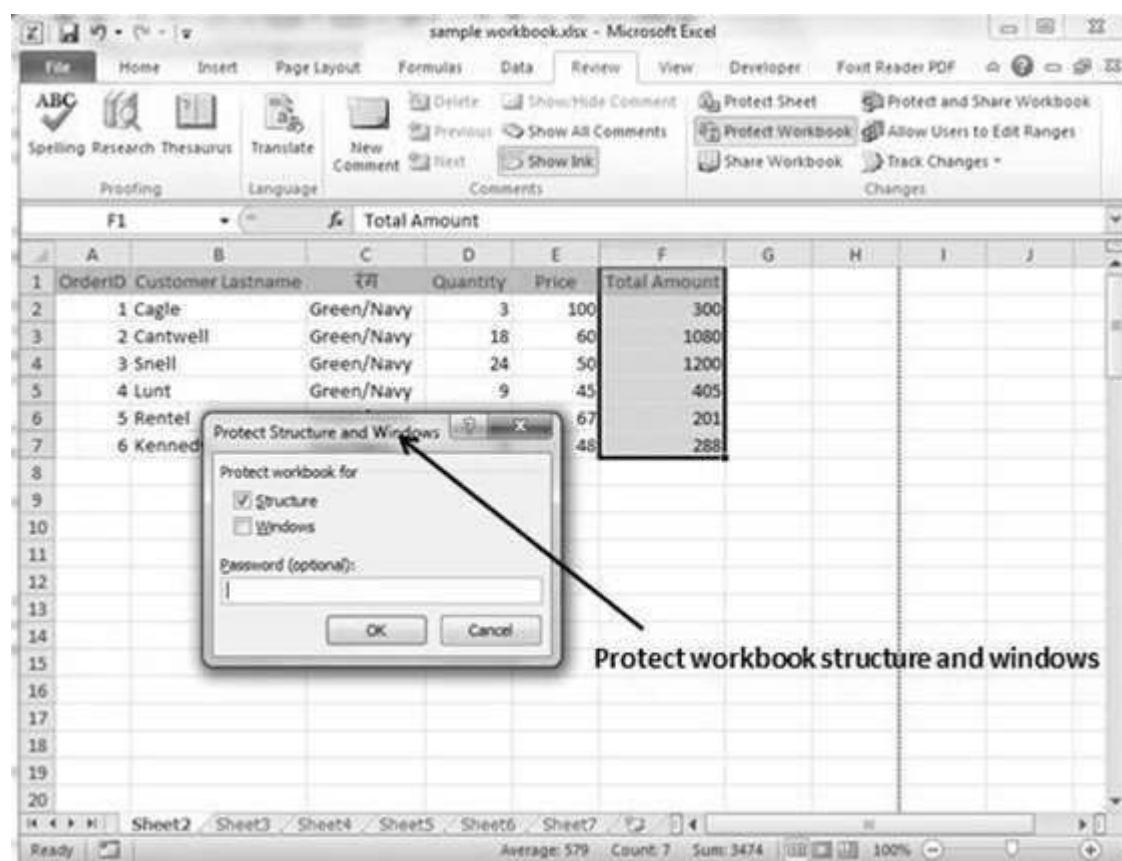

To remove a password from a workbook, repeat the same procedure. In Step 2, however, delete the existing password symbols.

Protecting Workbook's Structure and Windows

To prevent others (or yourself) from performing certain actions in a workbook, you can protect the workbook's structure and windows. When a workbook's structure and windows are protected, the user may not Add a sheet, Delete a sheet, Hide a sheet, unhide a sheet, etc., and may not be allowed to change the size or position of a workbook's windows respectively.

To protect a worksheet's structure and windows, follow the below mentioned steps.

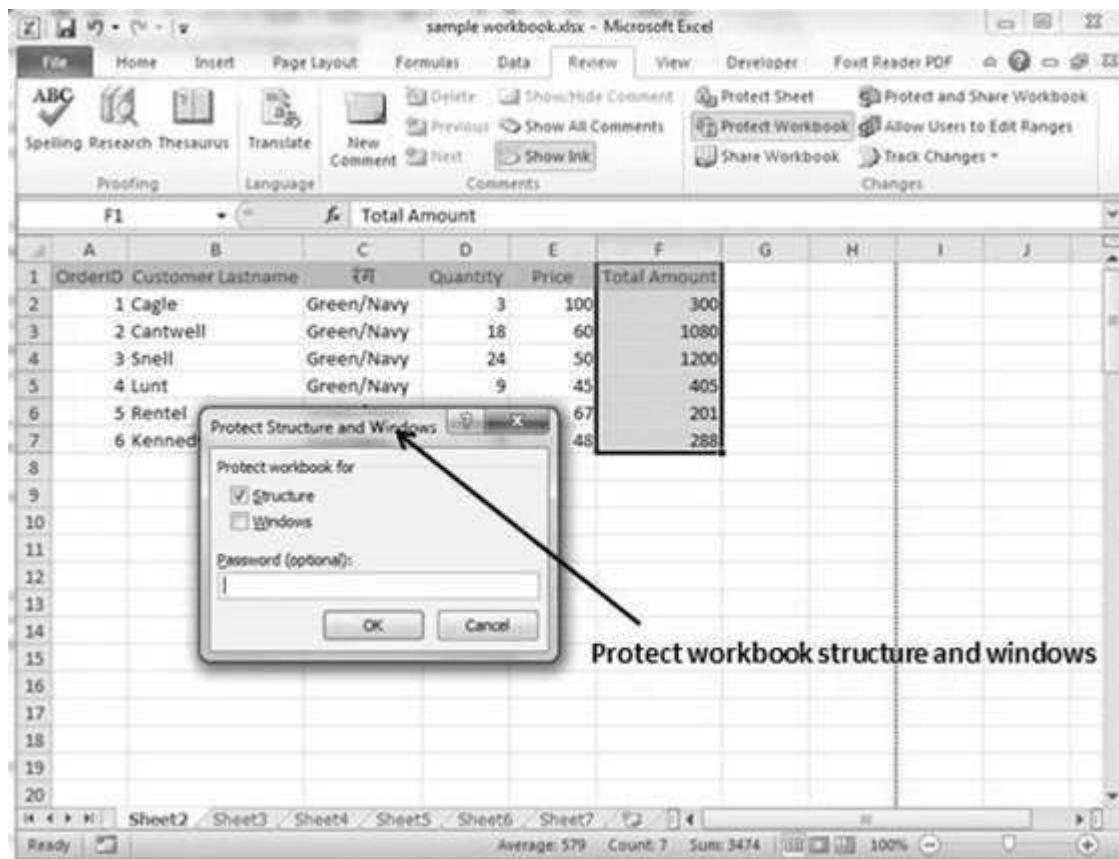

- Choose **Review** » **Changes group** » **Protect Workbook** to display the Protect Workbook dialog box.
- In the Protect Workbook dialog box, select the Structure check box and Windows check box.
- (Optional) Enter a password.
- Click OK.

63. DATA TABLES

Data Tables

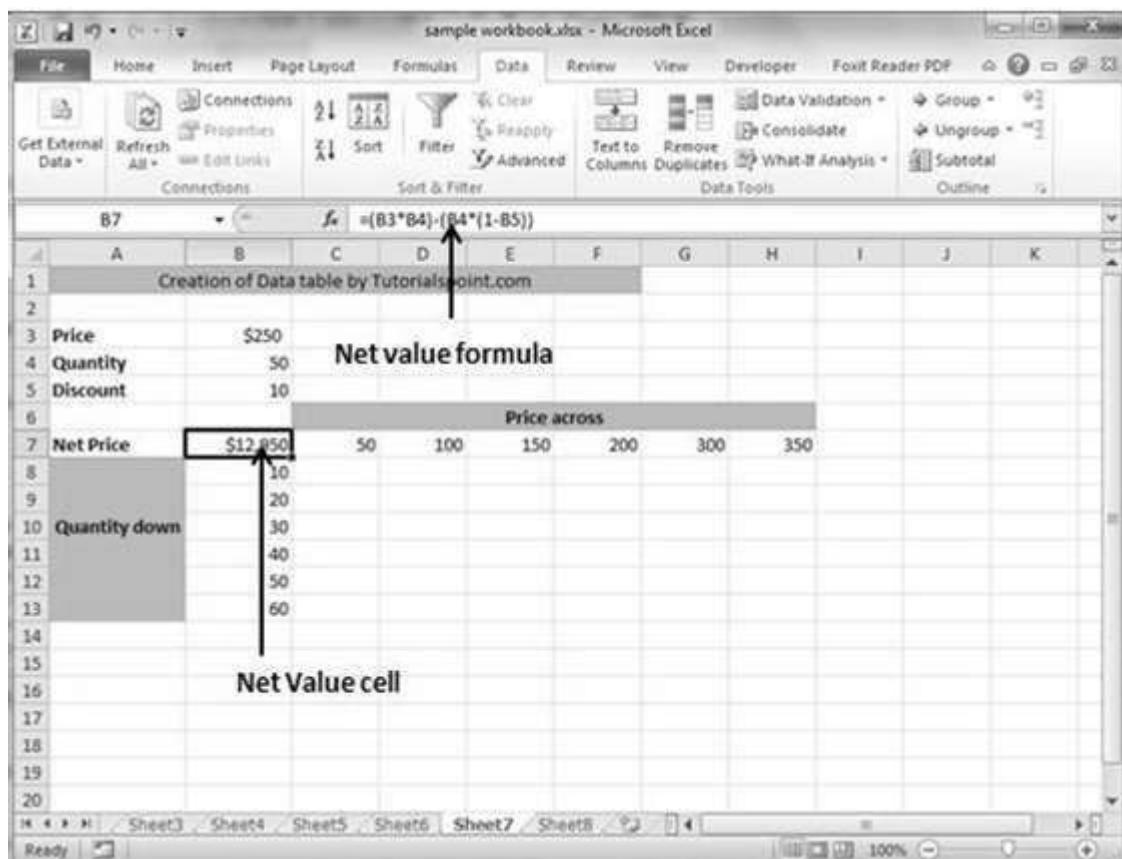

In Excel, a Data Table is a way to see different results by altering an input cell in your formula. Data tables are available in **Data Tab** » **What-If analysis dropdown** » **Data table** in MS Excel.

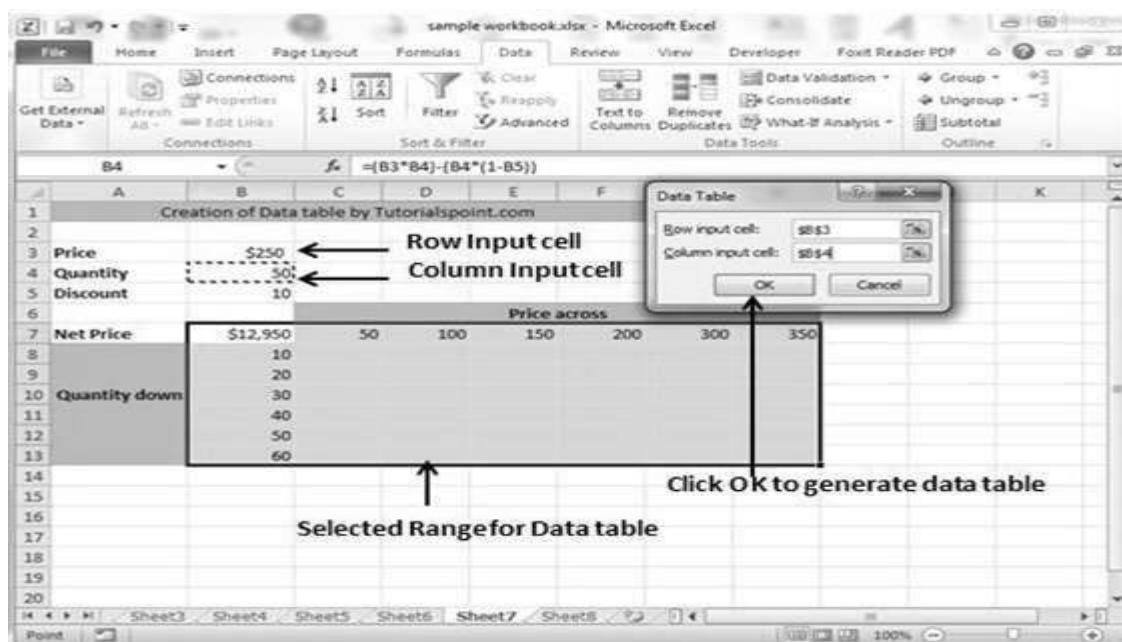

Data Table with Example

Now, let us see data table concept with an example. Suppose you have the Price and quantity of many values. Also, you have the discount for that as third variable for calculating the Net Price. You can keep the Net Price value in the organized table format with the help of the data table. Your Price runs horizontally to the right while quantity runs vertically down. We are using a formula to calculate the Net Price as Price multiplied by Quantity minus total discount (Quantity * Discount for each quantity).

Excel 2010

Now, for creation of data table, select the range of data table. Choose **Data Tab** » **What-If analysis dropdown** » **Data table**. It will give you dialogue asking for Input row and Input Column. Give the Input row as Price cell (In this case cell B3) and Input column as quantity cell (In this case cell B4). Please see the below screen-shot.

Excel 2010

Clicking OK will generate data table as shown in the below screen-shot. It will generate the table formula. You can change the price horizontally or quantity vertically to see the change in the Net Price.

The screenshot shows a Microsoft Excel spreadsheet titled "sample workbook.xlsx - Microsoft Excel". The ribbon is visible at the top with tabs like File, Home, Insert, Page Layout, Formulas, Data, Review, View, Developer, and Print Preview PDF. The Data tab is selected, showing various data analysis tools like Get External Data, Refresh All, Connections, Sort & Filter, Advanced, Text to Columns, Remove Duplicates, Data Validation, Consolidate, What-If Analysis, Group, Ungroup, Subtotal, and Outline.

In the formula bar, the formula `=TABLE(B3,B4)` is entered. The table starts at cell C8. The first row contains headers: "Price" (\$250), "Quantity" (50), and "Discount" (10). The second row is labeled "Net Price" and lists values: \$12,950, 50, 100, 150, 200, 300, 350. The third row lists quantities: 10, 20, 30, 40, 50, 60. The fourth row lists prices: 590, 1180, 1770, 2360, 2950, 3540. The fifth row lists prices: 1090, 2180, 3270, 4360, 5450, 6540. The sixth row lists prices: 1590, 3180, 4770, 6360, 7950, 9540. The seventh row lists prices: 2090, 4180, 6270, 8360, 10450, 12540. The eighth row lists prices: 3090, 6180, 9270, 12360, 15450, 18540. The ninth row lists prices: 3590, 7180, 10770, 14360, 17950, 21540.

Annotations on the left side of the table highlight "Quantity down" and point to the quantity column. Annotations on the right side point to the "Generated data table" and the "Changes in Quantity reflects in table".

		Price across						
	Price	Quantity	Discount	10	20	30	350	
7	Net Price	\$12,950	50	100	150	200	300	350
8		10	590	1090	1590	2090	3090	3590
9		20	1180	2180	3180	4180	6180	7180
10	Quantity down	30	1770	3270	4770	6270	9270	10770
11		40	2360	4360	6360	8360	12360	14360
12		50	2950	5450	7950	10450	15450	17950
13		60	3540	6540	9540	12540	18540	21540

64. PIVOT TABLES

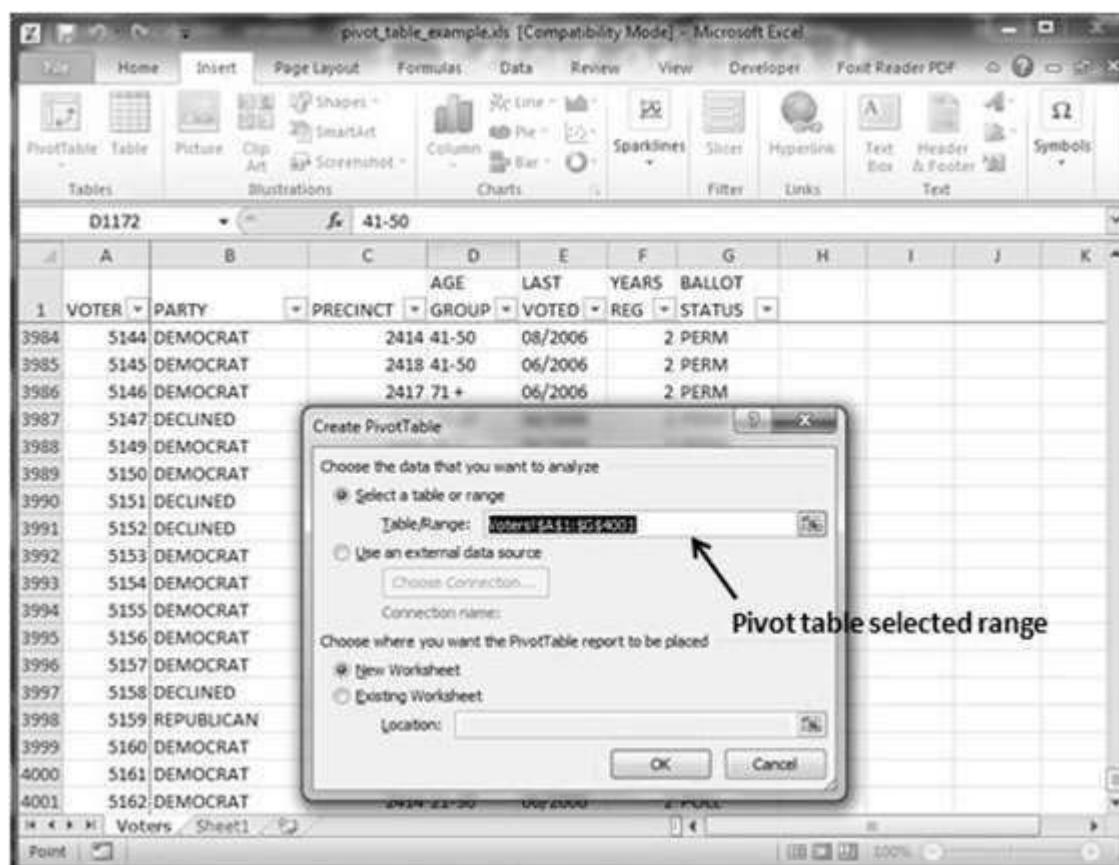

Pivot Tables

A pivot table is essentially a dynamic summary report generated from a database. The database can reside in a worksheet (in the form of a table) or in an external data file. A pivot table can help transform endless rows and columns of numbers into a meaningful presentation of the data. Pivot tables are very powerful tool for summarized analysis of the data.

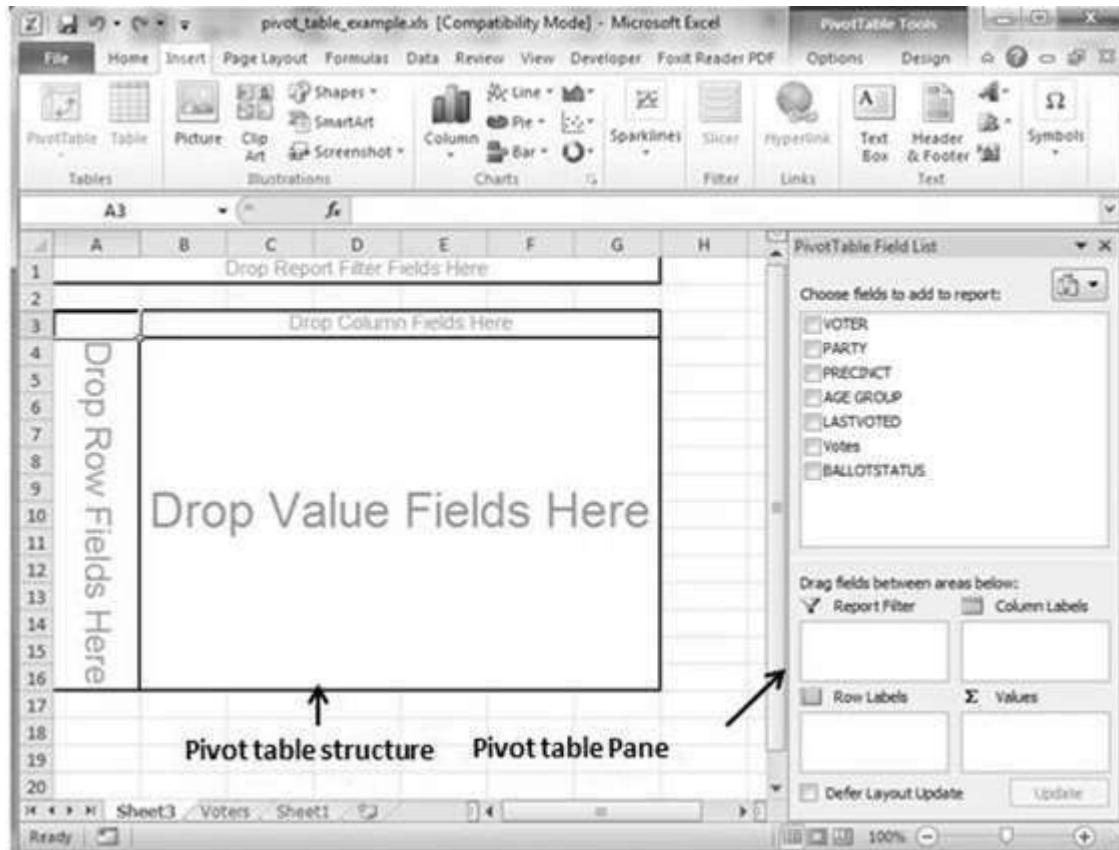

Pivot tables are available under **Insert tab** » **PivotTable dropdown** » **PivotTable**.

Pivot Table Example

Now, let us see Pivot table with the help of example. Suppose you have huge data of voters and you want to see the summarized data of voter Information per party, then you can use the Pivot table for it. Choose **Insert tab** » **Pivot Table** to insert pivot table. MS Excel selects the data of the table. You can select the pivot table location as existing sheet or new sheet.

This will generate the Pivot table pane as shown below. You have various options available in the Pivot table pane. You can select fields for the generated pivot table.

- **Column labels:** A field that has a column orientation in the pivot table. Each item in the field occupies a column.
- **Report Filter:** You can set the filter for the report as year, then data gets filtered as per the year.
- **Row labels:** A field that has a row orientation in the pivot table. Each item in the field occupies a row.
- **Values area:** The cells in a pivot table that contain the summary data. Excel offers several ways to summarize the data (sum, average, count, and so on).

After giving input fields to the pivot table, it generates the pivot table with the data as shown below.

Generated Pivot Table

AGE GROUP	(All)	30030
Sum of Votes	Total	
PARTY	674	
AMERICAN INDEP	674	
DECLINED	6021	
DEMOCRAT	30030	
GREEN	450	
REPUBLICAN	18551	
Grand Total	55726	

Pivot table options: row filter, columns, rows, and sum

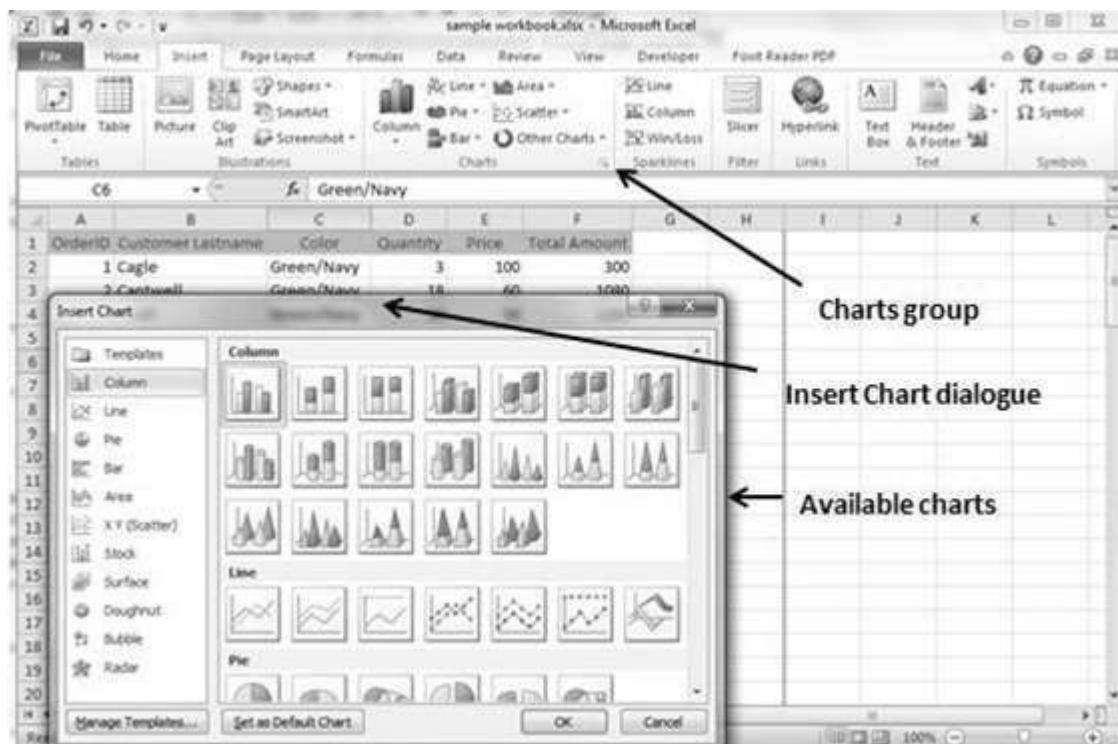

65. SIMPLE CHARTS

Charts

A chart is a visual representation of numeric values. Charts (also known as graphs) have been an integral part of spreadsheets. Charts generated by early spreadsheet products were quite crude, but they have improved significantly over the years. Excel provides you with the tools to create a wide variety of highly customizable charts. Displaying data in a well-conceived chart can make your numbers more understandable. Because a chart presents a picture, charts are particularly useful for summarizing a series of numbers and their interrelationships.

Types of Charts

There are various chart types available in MS Excel as shown in the below screenshot.

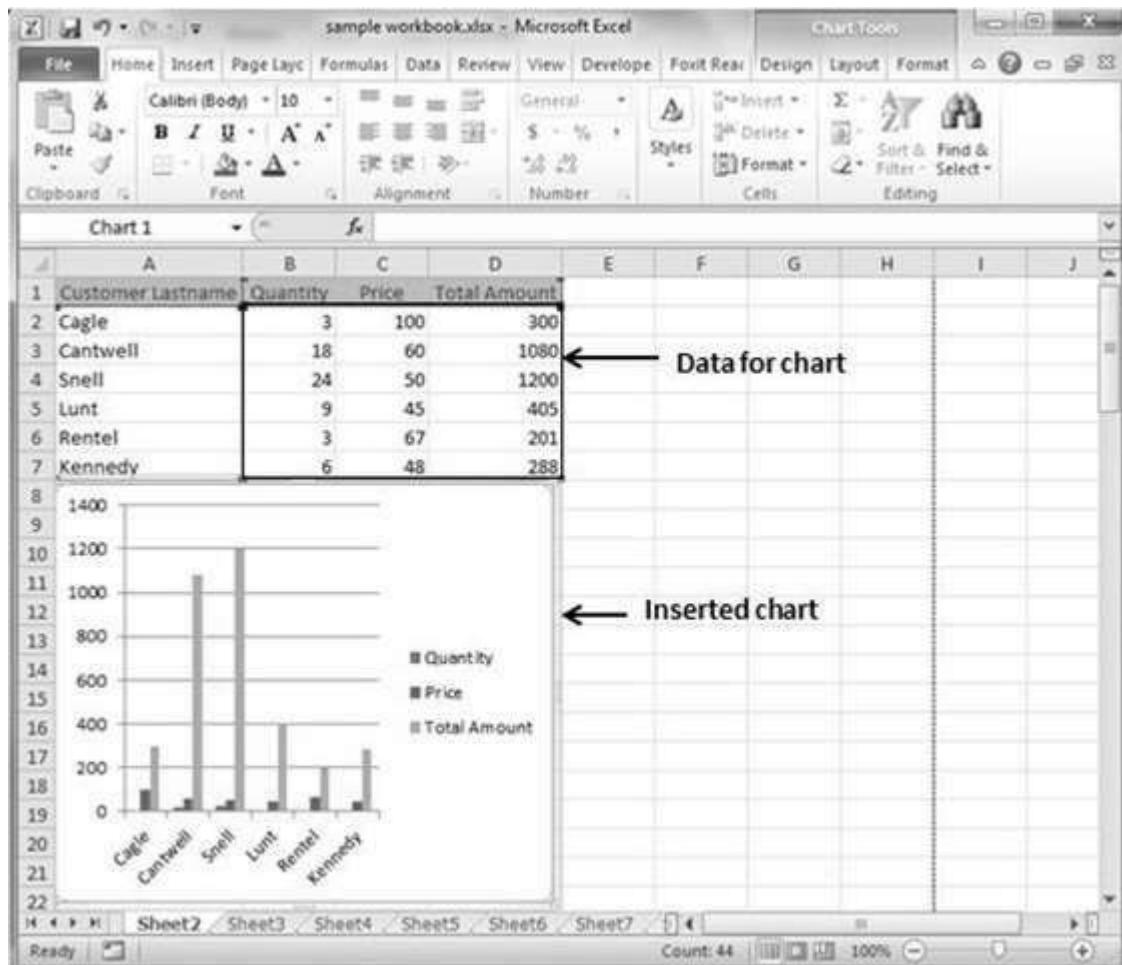

- **Column:** Column chart shows data changes over a period of time or illustrates comparisons among items.
- **Bar:** A bar chart illustrates comparisons among individual items.

- **Pie:** A pie chart shows the size of items that make up a data series, proportional to the sum of the items. It always shows only one data series and is useful when you want to emphasize a significant element in the data.
- **Line:** A line chart shows trends in data at equal intervals.
- **Area:** An area chart emphasizes the magnitude of change over time.
- **X Y Scatter:** An xy (scatter) chart shows the relationships among the numeric values in several data series, or plots two groups of numbers as one series of xy coordinates.
- **Stock:** This chart type is most often used for stock price data, but can also be used for scientific data (for example, to indicate temperature changes).
- **Surface:** A surface chart is useful when you want to find the optimum combinations between two sets of data. As in a topographic map, colors and patterns indicate areas that are in the same range of values.
- **Doughnut:** Like a pie chart, a doughnut chart shows the relationship of parts to a whole; however, it can contain more than one data series.
- **Bubble:** Data that is arranged in columns on a worksheet, so that x values are listed in the first column and corresponding y values and bubble size values are listed in adjacent columns, can be plotted in a bubble chart.
- **Radar:** A radar chart compares the aggregate values of a number of data series.

Creating Chart

To create charts for the data by below mentioned steps.

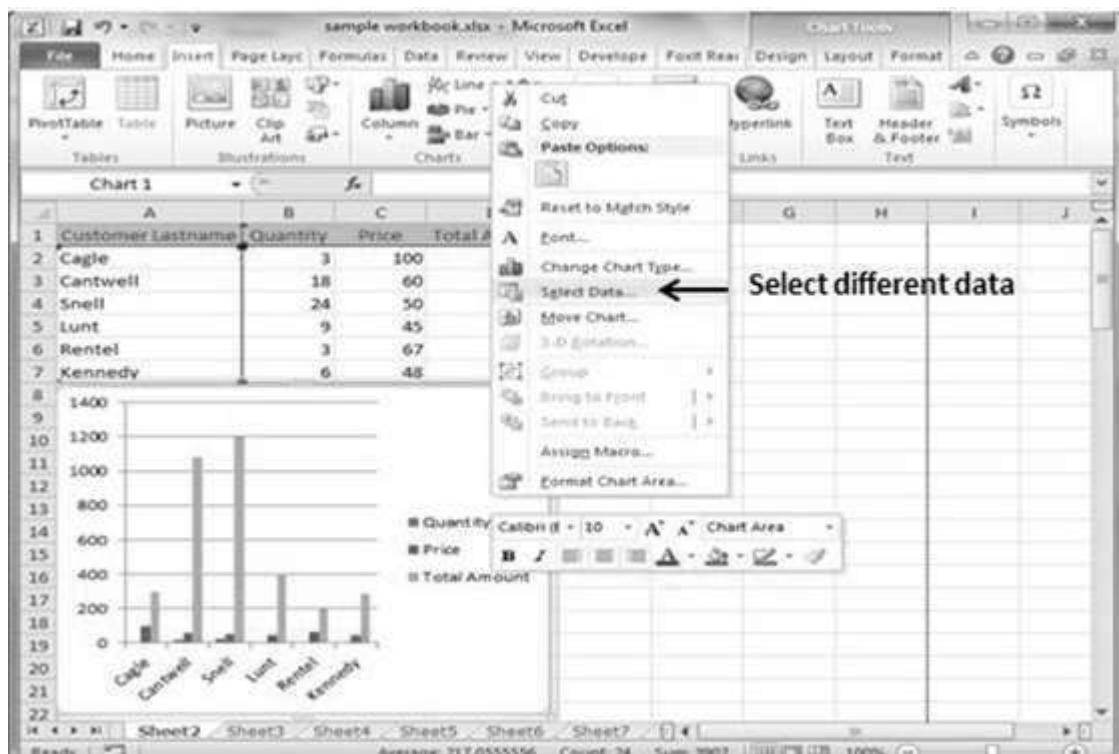

- Select the data for which you want to create the chart.
- Choose **Insert Tab** » **Select the chart or click on the Chart group** to see various chart types.
- Select the chart of your choice and click OK to generate the chart.

Editing Chart

You can edit the chart at any time after you have created it.

- You can select the different data for chart input with **Right click on chart**
 » **Select data.** Selecting new data will generate the chart as per the new data, as shown in the below screen-shot.

- You can change the X axis of the chart by giving different inputs to X-axis of chart.
- You can change the Y axis of chart by giving different inputs to Y-axis of chart.

66. PIVOT CHARTS

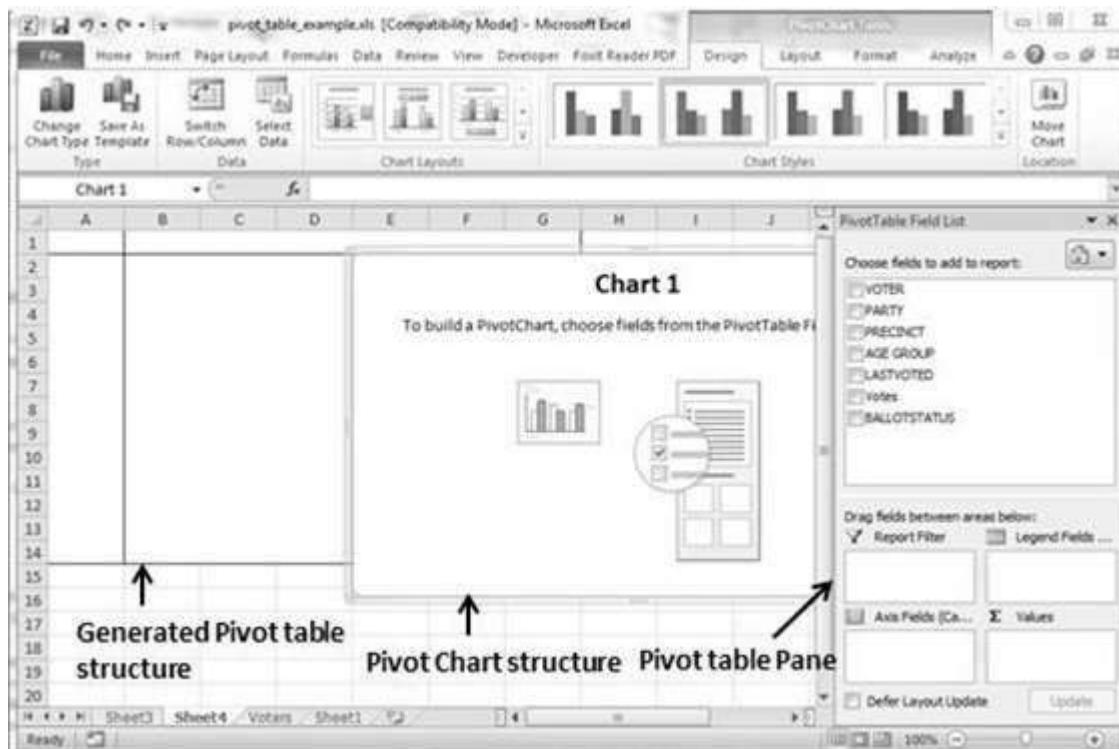

Pivot Charts

A pivot chart is a graphical representation of a data summary, displayed in a pivot table. A pivot chart is always based on a pivot table. Although Excel lets you create a pivot table and a pivot chart at the same time, you can't create a pivot chart without a pivot table. All Excel charting features are available in a pivot chart.

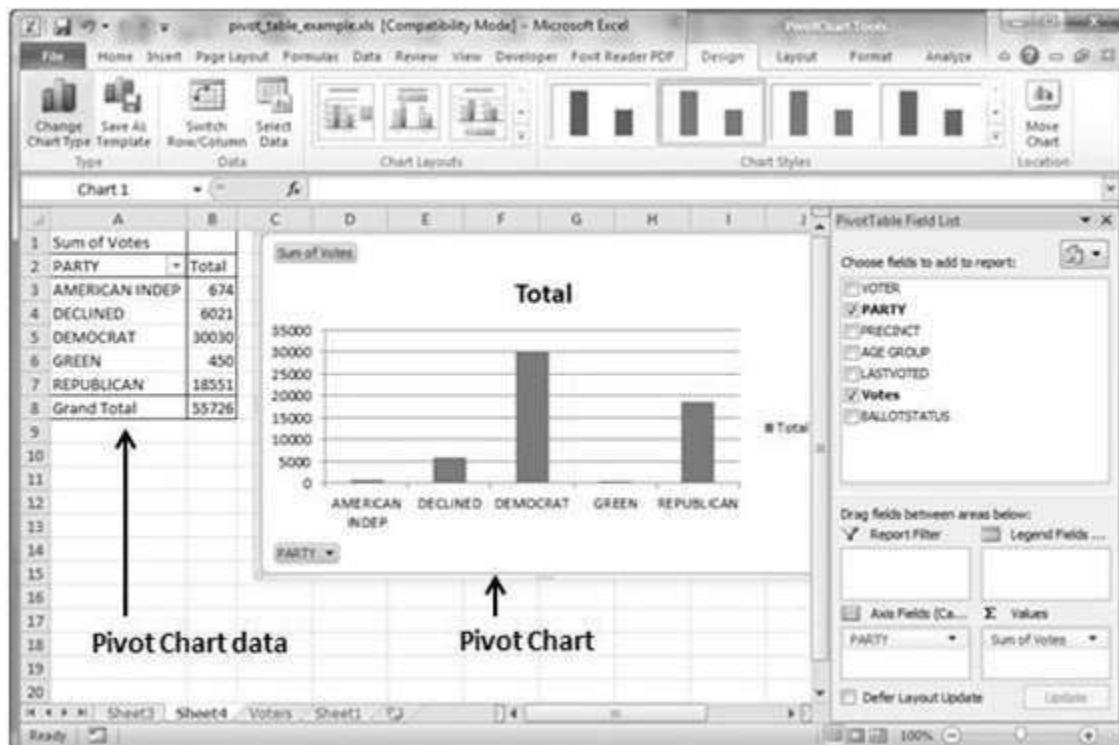

Pivot charts are available under **Insert tab** » **PivotTable dropdown** » **PivotChart**.

Pivot Chart Example

Now, let us see Pivot table with the help of an example. Suppose you have huge data of voters and you want to see the summarized view of the data of voter Information per party in the form of charts, then you can use the Pivot chart for it. Choose **Insert tab** » **Pivot Chart** to insert the pivot table.

MS Excel selects the data of the table. You can select the pivot chart location as an existing sheet or a new sheet. Pivot chart depends on automatically created pivot table by the MS Excel. You can generate the pivot chart in the below screenshot.

67. KEYBOARD SHORTCUTS

MS Excel Keyboard Short-cuts

MS Excel offers many keyboard short-cuts. If you are familiar with windows operating system, you should be aware of most of them. Below is the list of all the major shortcut keys in Microsoft Excel.

- **Ctrl + A** : Selects all contents of the worksheet.
- **Ctrl + B** : Bold highlighted selection.
- **Ctrl + I** : Italicizes the highlighted selection.
- **Ctrl + K** : Inserts link.
- **Ctrl + U** : Underlines the highlighted selection.
- **Ctrl + 1** : Changes the format of selected cells.
- **Ctrl + 5** : Strikethrough the highlighted selection.
- **Ctrl + P** : Brings up the print dialog box to begin printing.
- **Ctrl + Z** : Undo last action.
- **Ctrl + F3** : Opens Excel Name Manager.
- **Ctrl + F9**: Minimizes the current window.
- **Ctrl + F10** : Maximizes the currently selected window.
- **Ctrl + F6** : Switches between open workbooks or windows.
- **Ctrl + Page up** : Moves between Excel work sheets in the same Excel document.
- **Ctrl + Page down** : Moves between Excel work sheets in the same Excel document.
- **Ctrl + Tab** : Moves between Two or more open Excel files.
- **Alt + =** : Creates a formula to sum all of the above cells
- **Ctrl + '** : Inserts the value of the above cell into cell currently selected.
- **Ctrl + Shift + !** : Formats the number in comma format.

- **Ctrl + Shift + \$** : Formats the number in currency format.
- **Ctrl + Shift + #** : Formats the number in date format.
- **Ctrl + Shift + %** : Formats the number in percentage format.
- **Ctrl + Shift + ^** : Formats the number in scientific format.
- **Ctrl + Shift + @** : Formats the number in time format.
- **Ctrl + Arrow key** : Moves to the next section of text.
- **Ctrl + Space** : Selects the entire column.
- **Shift + Space** : Selects the entire row.
- **Ctrl + -** : Deletes the selected column or row.
- **Ctrl + Shift + =** : Inserts a new column or row.
- **Ctrl + Home** : Moves to cell A1.
- **Ctrl + ~** : Switches between showing Excel formulas or their values in cells.
- **F2** : Edits the selected cell.
- **F3** : After a name has been created F3 will paste names.
- **F4** : Repeat last action. For example, if you changed the color of text in another cell pressing F4 will change the text in cell to the same color.
- **F5** : Goes to a specific cell. For example, C6.
- **F7** : Spell checks the selected text or document.
- **F11** : Creates chart from the selected data.
- **Ctrl + Shift + ;** : Enters the current time.
- **Ctrl + ;** : Enters the current date.
- **Alt + Shift + F1** : Inserts New Worksheet.
- **Alt + Enter** : While typing text in a cell pressing Alt + Enter will move to the next line allowing for multiple lines of text in one cell.
- **Shift + F3** : Opens the Excel formula window.
- **Shift + F5** : Brings up the search box.
